Towards a general theory of resilience. Lessons from a multi-perspective research.

ERNICIP lecture, Brussels, 22/06/2016
Paul THERON, PhD, FBCI

Introducing myself briefly

Thales Communications & Security

- ❖ Cyber defence bid manager (Export)
- ❖ (Cyber) Resilience expert

Co-Head of the French “Aero spatial cyber resilience” research chair

- ❖ Founders: French Air Force + Thales + Dassault Aviation
- ❖ Interdisciplinary: Multi Agent Cyber Defence, Cognition, Engineering

My research: Toward a “general theory of resilience”?

- ❖ Individual cognition and peritraumatic resilience
- ❖ Systems' (cyber) resilience
- ❖ Resilience of work collectives / Teams
- ❖ Corporate resilience
- ❖ Critical infrastructures' resilience
- ❖ Multilevel governance of critical infrastructure resilience

CREST (Crises & Resilience – Economy, Society, Technology) is an independent research group.

It promotes interdisciplinary, multi perspective research on resilience.

Its object is the dynamics of resilience at the *pre, peri* and *post* incident stages.

It was started in 2006 as CREST (Cognition – Resilience – Trauma) and initiated the PhenoCognitive Analysis of individual cognition in action & peritraumatic resilience:
<https://sites.google.com/site/cognitionresilience/trauma/home>

Question to the class

Resilience is / can be defined as...

❖ Tour de table

Question to the class

We talk so much about resilience these days because...

❖ Tour de table

Agenda

What is resilience?

Governing resilience in the context of critical infrastructures

Conclusions

■ A definition of resilience

■ 7 findings & precepts about resilience

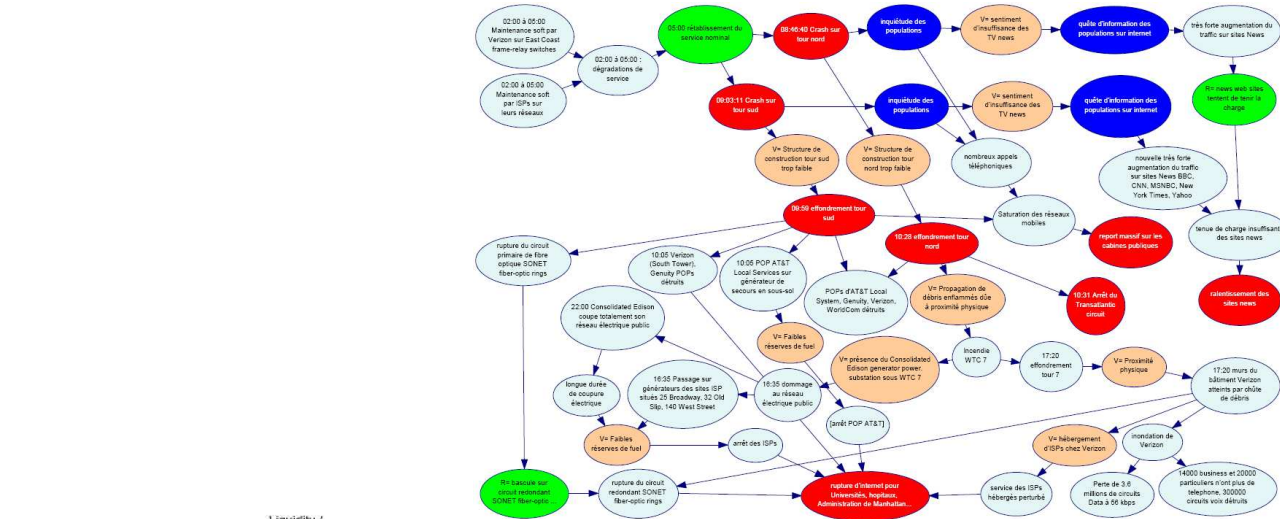

1st finding: why it is needed (Accept that complexity will defeat you)

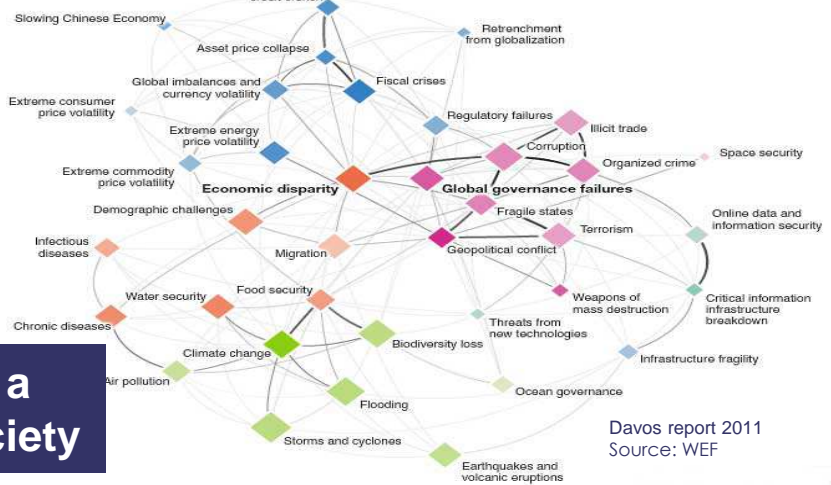

Rinaldi IEEE Control System Magazine 2001

Complexity stemming from interdependencies

Complexity of a crisis-prone society

Complexity of accidentogenesis

Davos report 2011 Source: WEF

The present document is CREST's property and may not be reproduced, modified, adapted, published, translated or disclosed to a third party, in any way, in whole or in part without CREST's prior written consent. © CREST, 2015. All rights reserved. Images and sources inserted in this document are the property of their sole owners, cited when their identity is known to CREST.

2nd finding: why it is so misunderstood (Think beyond words)

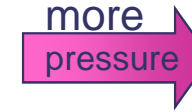

Fragile

Robust

Resilient

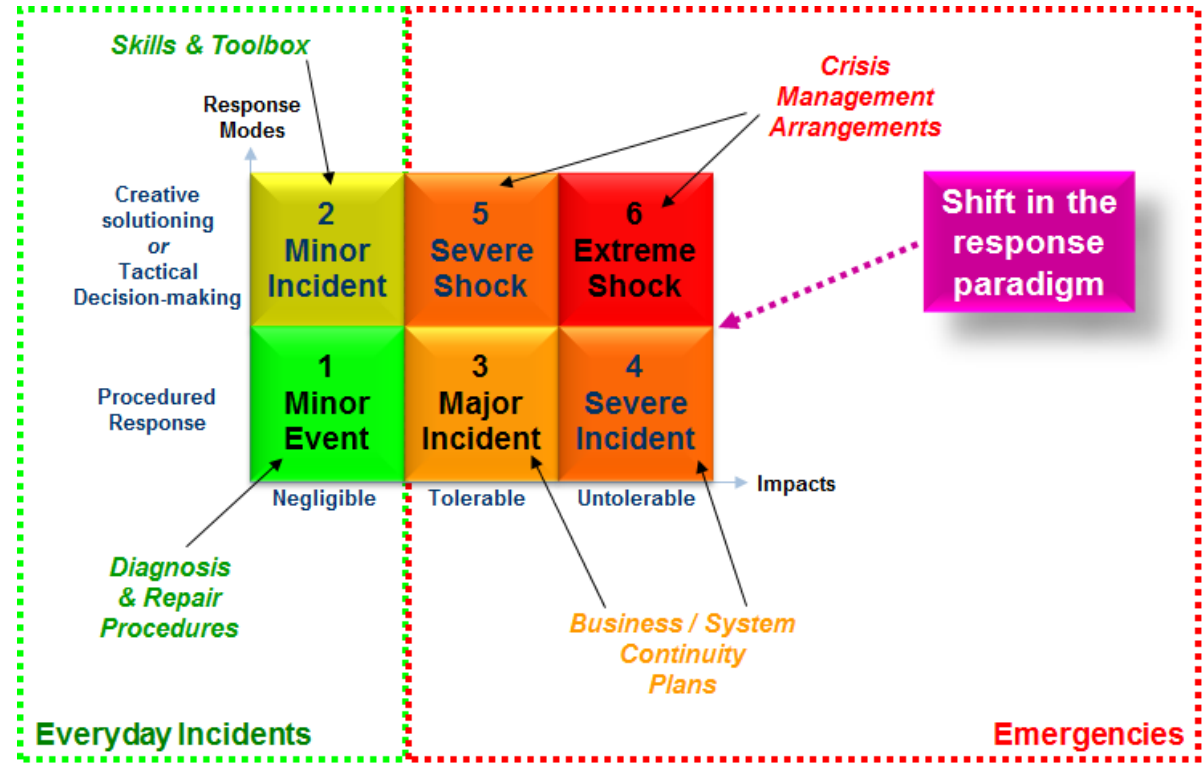

Yushi Fujita - Resilience Engineering Symposium, October 25-29, 2004, Soderkoping Brunn, Sweden

© Paul THERON – OPEN

3rd finding: what it helps to overcome (Set performance goals)

The present document is CREST's property and may not be reproduced, modified, adapted, published, translated or disclosed to a third party, in any way, in whole or in part without CREST's prior written consent. © CREST, 2015. All rights reserved. Images and sources inserted in this document are the property of their sole owners, cited when their identity is known to CREST.

The Incident Severity Scale

Théron, P. (2013)

4th finding: how it can be defined (Explain your policy)

A crisis is an experience of collapse

- ❖ Of a socio-technical system
- ❖ Under the effect of a major shock
 - Surprising
 - Destabilising
 - Frightening

Resilience is the aptitude of a socio-technical system to surmount crises

- ❖ But this is an “extremist” standpoint...
 - Every step counts even modest ones
 - Cumulative Engineering delivers resilience

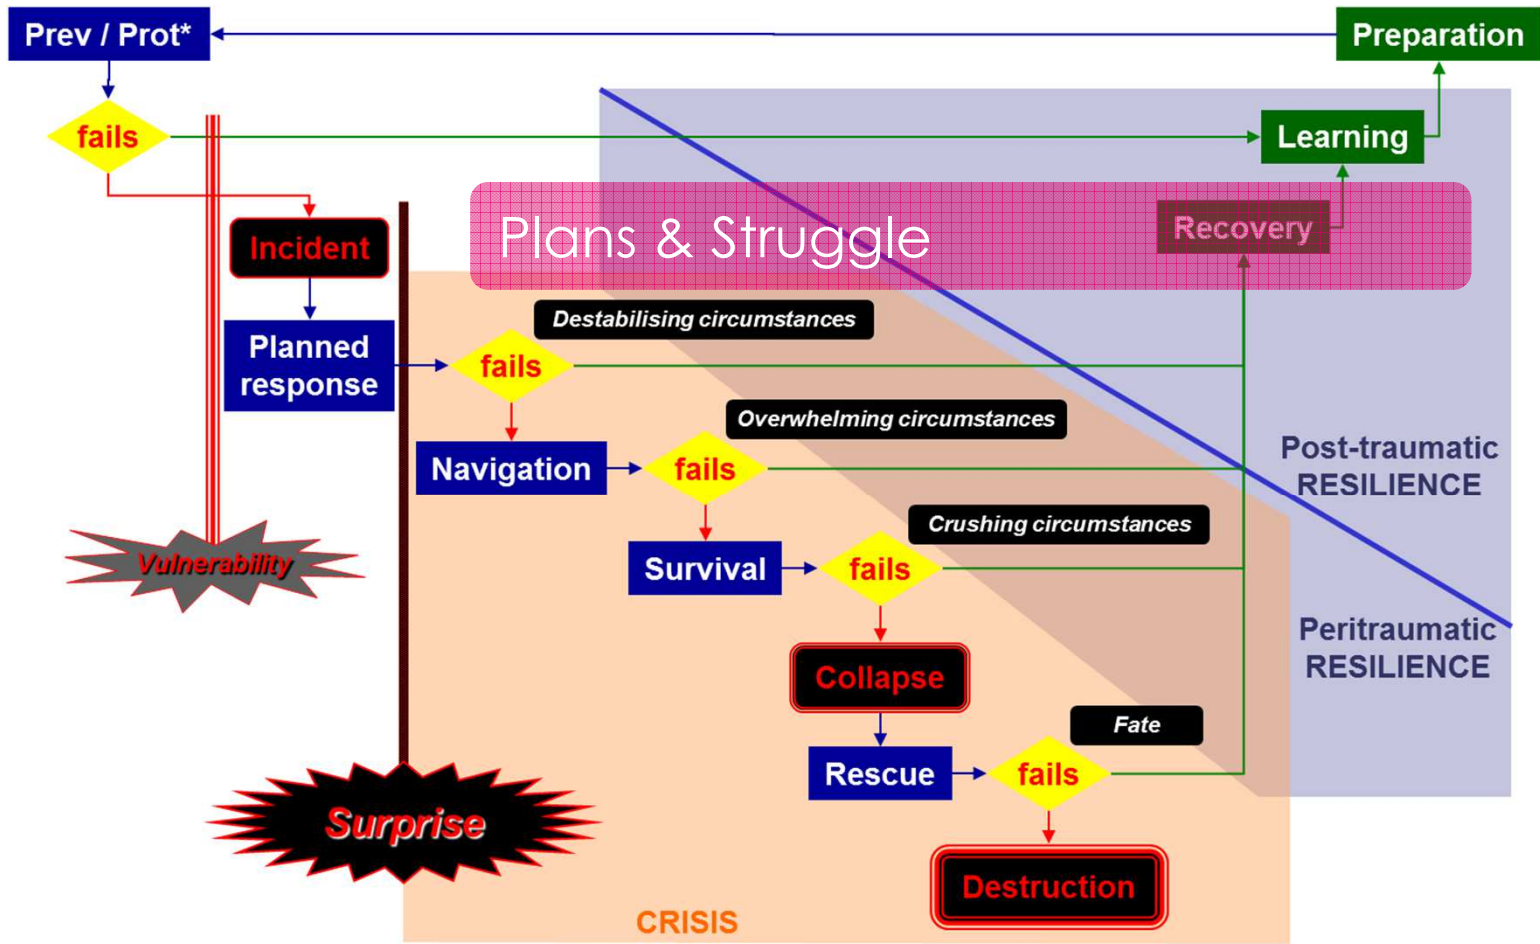

Resilience is the ability of a sociotechnical system

- ❖ Made of interacting human, technical and physical agents
- ❖ To surmount (together) adverse events, from mere incidents up to extreme shocks...

... through 5 activities to be run by all and for all

- ❖ Pre-incident = before incidents happen
 - Engineering : the system is built to avoid and resist expectable challenges, and to stand unexpectedness
- ❖ Peri-incident = while incidents are happening
 - Maintaining : the system finds ways to keep acting on its missions despite adversity
 - Resisting : the system finds ways to avoid collapsing and its possible destruction
 - Recovering : the system finds ways to return to a nominal course of life as soon as possible
- ❖ Post-incident = after incidents have happened
 - Rebounding : the system learns from and adapts to circumstances

5th finding: when it takes place (Prepare to fight)

* Prevention / Protection P Théron (2007-2011) Resilience V-Model Théron, P. (2013)

The present document is CREST's property and may not be reproduced, modified, published, translated or disclosed to a third party, in any way, in whole or in part without CREST's prior written consent - © CREST, 2015. All rights reserved. Images and sources inserted in this document are the property of their sole owners, cited when their identity is known to CREST.

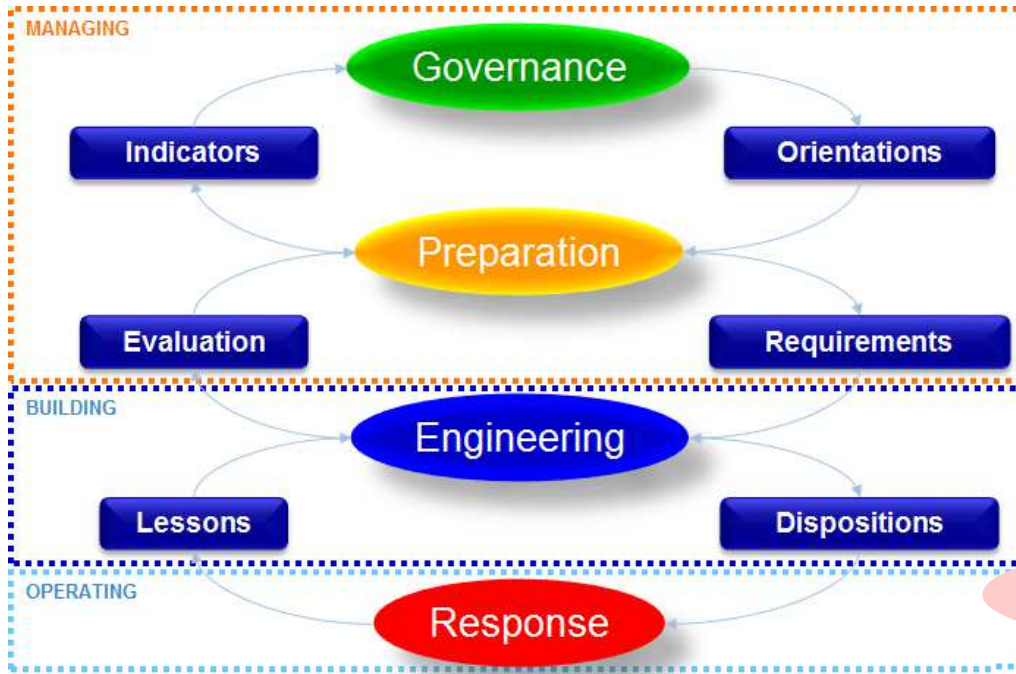

6th finding: what mechanisms engineering delivers (Act upon threats)

* Course of Things

The present document is CREST's property and may not be reproduced, modified, published, translated or disclosed to a third party, in any way, in whole or in part without CREST's prior written consent. © CREST, 2015. All rights reserved. Images and sources inserted in this document are the property of their sole owners, cited when their identity is known to CREST.

7th finding: how it is governed (Prepare to collaborate)

Today (mid 2016)

EU: the NIS Directive

- ❖ However, some exclusions following EP's resolution

EU: the CEN-CENELEC Cybersecurity Coordination Group (CSCG)

- ❖ On request from DG CONNECT
- ❖ Points to the need to coordinate cybersecurity standardisation across Europe

Sectorial initiatives

- ❖ Customisation of generic standards
- ❖ Creation of standards for EATM, Galileo, US Energy, etc.

There is still work ahead

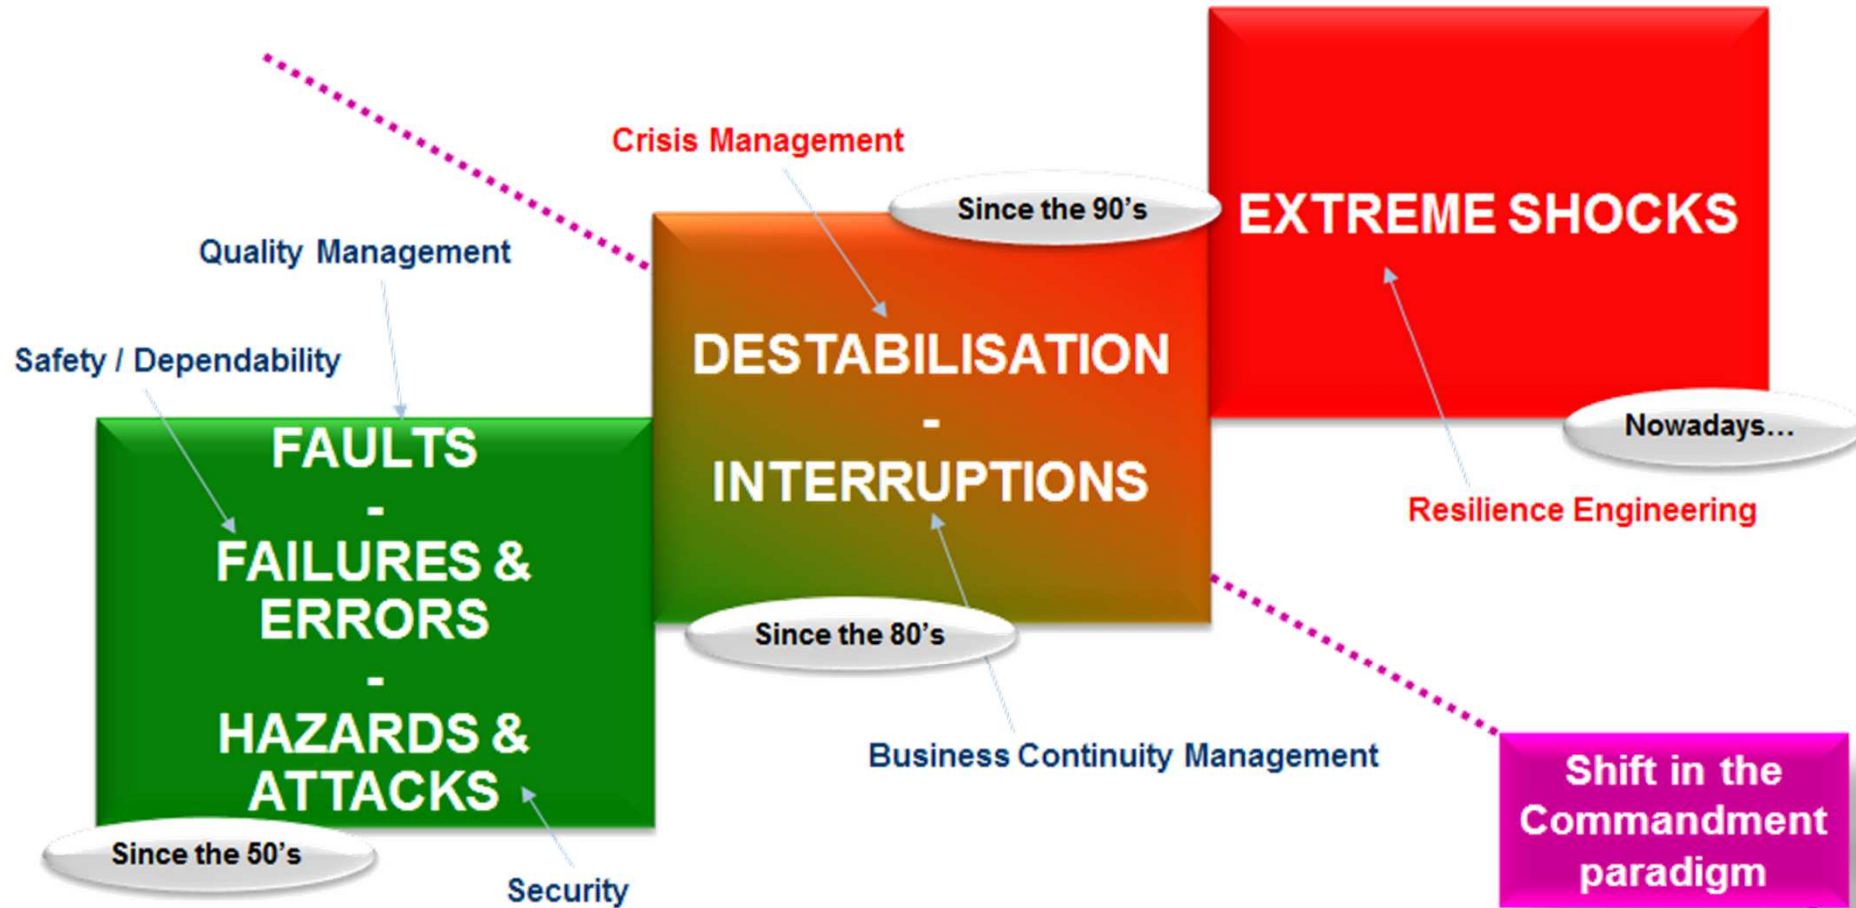

- ❖ But this shows an evolution of public policies

Conclusions

New standards for a doomed issue?

Conclusion 1: The shift towards resilience has emerged...

The present document is CREST's property and may not be reproduced, modified, published, translated or disclosed to a third party, in any way, in whole or in part, without CREST's prior written consent. © CREST, 2015. All rights reserved. Images and sources inserted in this document are the property of their sole owners, cited when their identity is known to CREST.

... from the recent concept of extreme shock

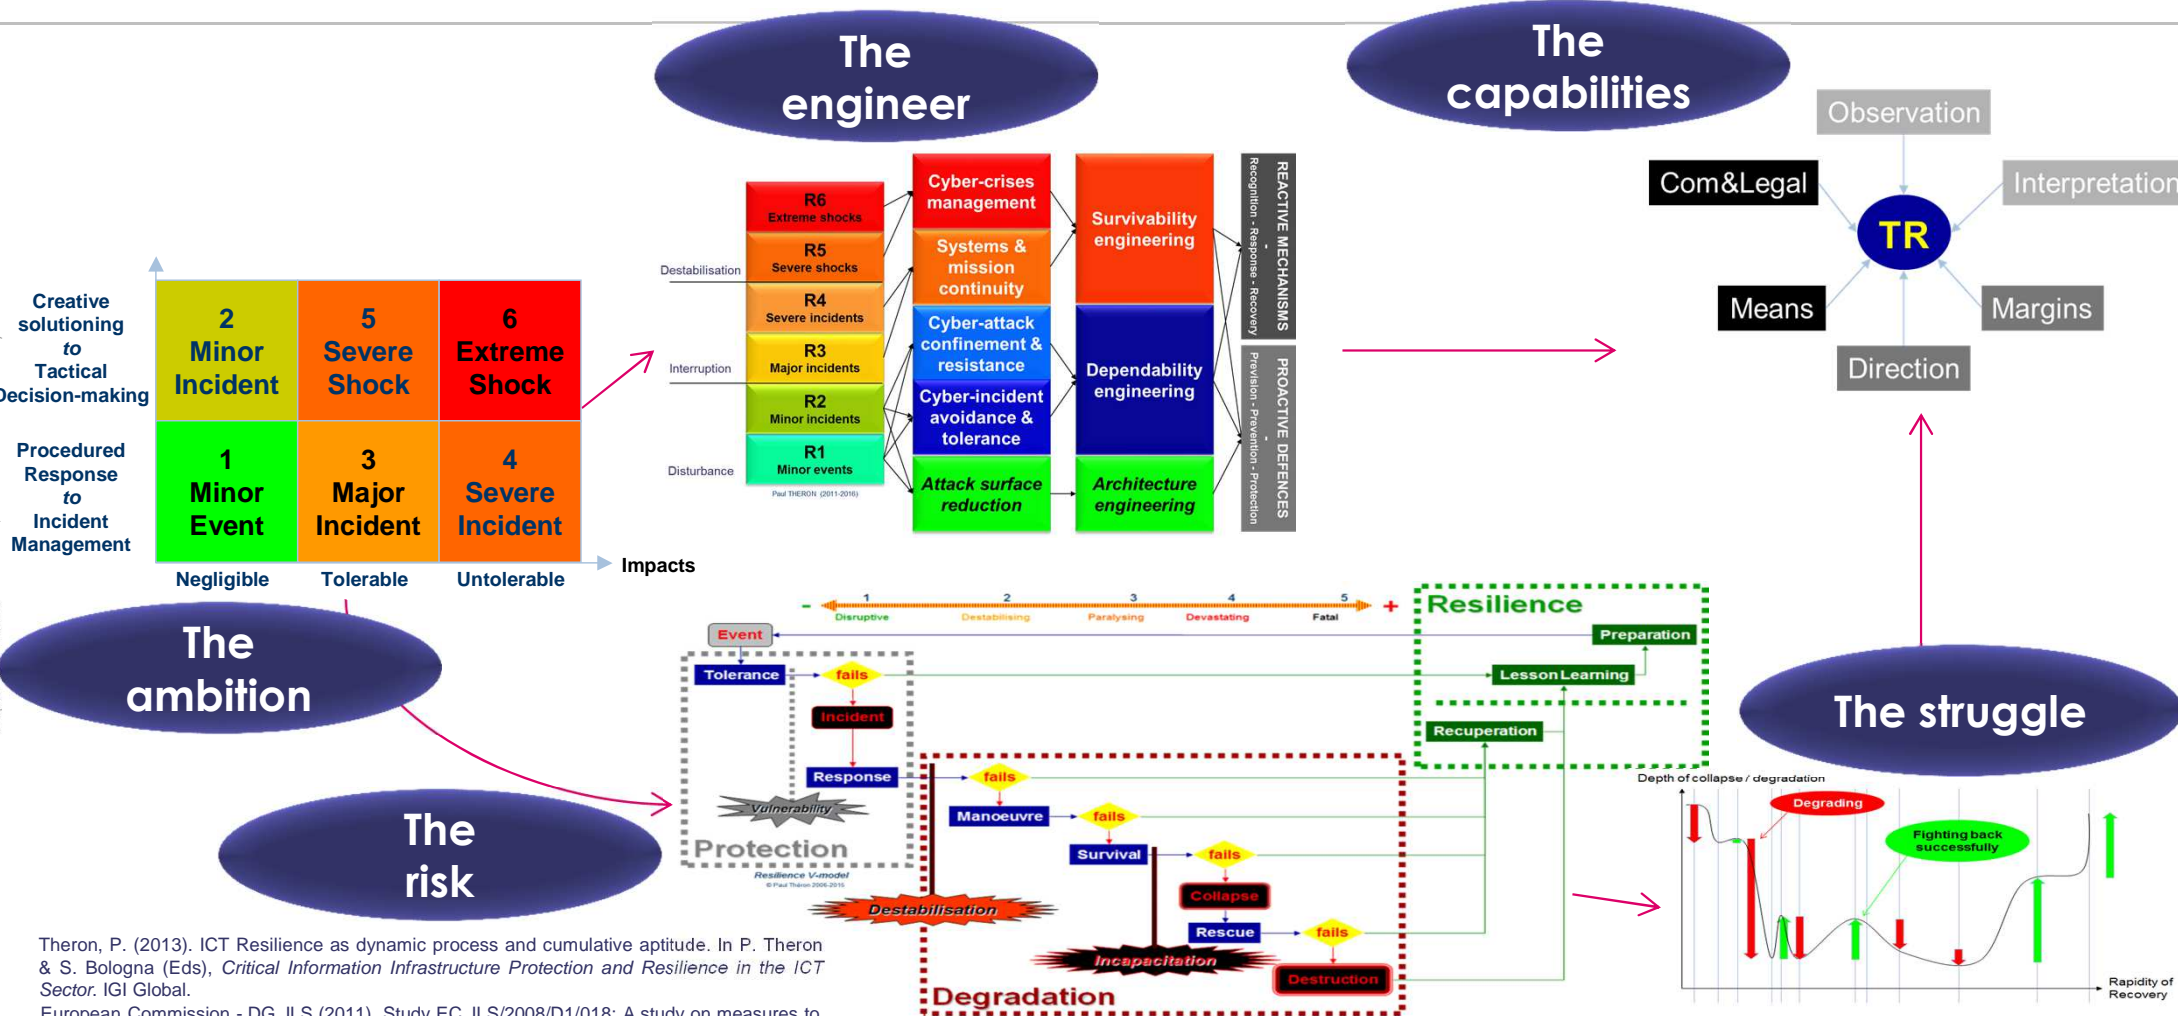

European Parliament (2011) Study Report on “*The role of ENISA in contributing to a coherent and enhanced structure of network and information security in the EU and internationally*”. Directorate General for Internal Policies ; Policy Department A: Economic and Scientific Policy ; Industry, Research and Energy, p21:

- ❖ «A recent OECD study* analysed whether cyber-incidents could lead to a 'global shock' as devastating as e.g. large-scale pandemics.
- ❖ They concluded that there are a **very few cyber events with the capacity to provoke a global shock.**
- ❖ Although they state that there are many examples where cyber-incidents have caused a great deal of harm and financial loss, they conclude that the greatest concern for policy makers are large scale events caused by **two different cyber-incidents taking place at the same time or a cyber-event taking place during another form of disaster or attack.** »

* OECD (2011) *Reducing Systemic Cybersecurity Risk*. P. Sommer, I. Brown, IFP/WKP/FGS(2011)

Conclusion 2: (Cyber) Resilience stems from empirical engineering

The present document is CREST's property and may not be reproduced, modified, published, translated or disclosed to a third party, in any way, in whole or in part without CREST's prior written consent. © CREST, 2015. Conclusion 3: Resilience engineering yields operational capabilities

Operational capabilities of resilient STS^o

P3R3 MECHANISMS	P3R3 OPERATIONAL CAPABILITIES
Prevision (of threats)	Cooperation between public & private agents
	Threat Intelligence (sources, means, ...)
	Threat analysis (targets, vectors, potential, ...)
Prevention (of threats)	Evaluation of threat priorities
	Reduction of threats at source or Deterrence
Protection (of systems against residual threats)	Public authorities' support & Public-Private collaboration
	Defence barriers engineering, deployment & operation
	Awareness Raising, Education & Training
Recognition (of an incident)	Management of systems' lifecycle & subcontractors
	Surveillance, Reconnaissance, & Detection of events
	Event analysis & Incident confirmation
Response (to incidents in order to preserve missions & systems against residual risks)	Alarm on incident
	Mobilisation process (confirmation, decision, activation)
	Commandment & operational chain & systems
	Reaction plans (defence, manoeuvre, survival, rescue)
	Reaction (Forces & other tactical capacities)
Recovery (of missions & systems)	Traces management and exploitation & Forensics
	Investigations – Legal suits – Retaliation
	Lesson Learning & Sharing
	Repair & Reconstruction
	Adaptation & Improvement

The present document is CREST's property and may not be reproduced, modified, adapted, published, translated or disclosed to a third party, in any way, in whole or in part without CREST's prior written consent. © CREST, 2015.
