Abstract

We present a new reference Grammar of French (La Grande Grammaire du français), which is a collective project (gathering around fifty contributors), producing a book (about 2200 pages, to be published en 2011) and associated databases. Like the recent reference grammars of the other Romance Languages, it takes into account the important results of the linguistic research of the past thirty years, while aiming at a non specialist audience and avoiding formalization. We differ from existing French grammar by being focused on contemporary French from a purely descriptive point of view, and by taking spoken data into account. We include a description of all the syntactic phenomena, as well as lexical, semantic, pragmatic and prosodic insights, specially as they interact with syntax. The analysis concerns the data from contemporary written French, but also includes data from spoken corpora and regional or non standard French (when accessible). Throughout the grammar, a simple phrase structure grammar is used, in order to maintain a common representation. The analyses are modular with a strict division of labor between morphology, syntax and semantics. From the syntactic point of view, POS are also distinguished from grammatical relations (or functions). The databases include a terminological glossary, different lexical databases for certain POS, certain valence frames and certain semantic classes, and a bibliographical database.

1. Presentation of the project

Sizable comprehensive grammars, written by linguists but aiming at a larger audience, have been published for several European languages: for Italian, the Grande Grammatica italiana di consultazione (Renzi, Salvi, & Cardinaletti, 1989-1991), for Spanish the Gramatica descriptiva de la lengua española (Bosque & Demonte, 1999), for Catalan the Gramàtica del Catalá contemporani (Solà et al. 2002), for English the Cambridge Grammar of the English Language (Huddleston & Pullum, 2002).

Nothing of the sort exists for French. Most grammar books are normative, while our aim, as linguists, is purely descriptive. The best existing descriptive French grammars are smaller, written by 2 or 3 authors, and mainly based on written literary French: M. Grevisse, A. Goosse (1936-2008) Le Bon Usage, M. Riegel et al. (1994-2009), La grammaire méthodique du français. While useful, they are based on a “rules and exceptions” approach, with no clear-cut distinctions between grammatical relations and categories, between syntax and semantics. They are not focused on the modern stage of the language, including references to 17th or 18th century authors such as Corneille or Marivaux. 1

Our project, called the Grande Grammaire du français is an international research project, which started in 2001 and was sponsored by the French CNRS. It will produce a book of about 2200 pages, to be published in 2011, and several associated electronic databases. It is a collective project, with 3 editors (Anne Abeillé, Annie Delaveau, Danièle Godard), gathering more than 50 authors, from different countries. 2 Like other large grammars for other Romance languages, it includes the results of recent linguistic research and makes them accessible to a larger audience. It is systematic, fully explicit, but not formalized; it uses both conventional and modern terminology, with explicit definitions and a rich array of examples.

We aim at a complete description of all syntactic phenomena of French, while also taking into account some morphological, lexical, semantic, pragmatic and prosodic aspects. Our descriptions are based on speakers’

1 For a more detailed comparison with other grammars, including Damourette & Pichon (1911-1946), see Abeillé, Delaveau, Godard 2007.

Our objectives are as follows:
- describe the variety of uses in modern French, both written and spoken, in France and abroad;
- synthesize existing linguistic knowledge, complete it, and make it accessible also to non linguists;
- clarify and stabilize grammatical terminology (often obscure, not modular, and variable from one French grammar to another).

As our focus is on « ordinary » French (to use Gadet’s 1989 term), the data we analyse come from a variety of sources:
- excerpts from available written corpora (Frantext, newspapers such as Le Monde, le Soir...)
- excerpts from spoken available corpora (Elicop, Ester, Corpaix, C-oral-rom, CRFP, Sankoff-Cedegren corpus...)  
- constructed examples for simple cases and ungrammatical forms.

For language variation, we also rely on a team of “regional” experts coordinated by Françoise Gadet.

2. The book

The book will comprise 7 millions characters (about 2200 pages), with two parts: La phrase et ses constituants (the clause and its constituents), De la phrase au discours (from sentence to discourse).

It is divided into 20 chapters concerned with all major problems of French syntax, and their interaction with the lexicon, morphology, semantics, discourse and prosody. Five chapters are each devoted to a part of speech (POS): Verb, Noun, Adjective, Preposition, Adverb, while three are devoted to a certain type of phrase (Sentence, Relative clause) or construction (Complex predicates, Coordination). Some chapters are more semantically oriented: those on determination and quantification, on proforms, on negation, on tense, aspect and mode, on comparison or adverbial adjuncts (« circumstances »). We also have a chapter on clause types, one on word order, one on discourse, one on phonology and prosody, one on punctuation and the new writing codes (such as those found in SMS).

We also include a glossary and a comprehensive bibliography.

3. The data

We describe a variety of data from modern French (after 1950), based on common usage, both written (newspapers, novels) and spoken (radio, interviews).

We define an appropriate marking to distinguish whether these data are attested or not, grammatical or not, standard or not, spoken or not, regional or not (see Table 1). We call «non standard» those existing forms which are sociologically stigmatized. We call «regional» forms found in several regions and not stigmatized there. For example, the comparative correlatives are introduced by a comparative adverb (or adjective) in standard French (1a), but in Belgium and Provence, they may be introduced by au preceding the comparative form:

\[(1) \begin{align*}
& a \quad \text{Plus il pleut plus il se plaint} \\
& \quad \text{(the more it rains the more he complains)} \\
& b \quad \text{R Au plus il pleut, au plus il se plaint} \\
& \quad \text{(the more it rains the more he complains)}
\end{align*}\]

Similarly, causative constructions with faire where the causee precedes the infinitival verb are marked: usually considered as typical of Quebec, they are in fact also found in Britain and in the French West Indies, so we mark them as regional:

\[(2) \begin{align*}
& a \quad \text{Il fait rire son fils} \\
& \quad \text{(he makes his son laugh)} \\
& b \quad \text{R Il fait son fils rire}
\end{align*}\]

Table 2: Morphosyntactic tags

We define six phrasal categories:

- NP (noun phrase): un enfant (a child), celui de Paul (that of Paul)
- AdvP (adverbial phrase): très bien (very well), pas du tout (not at all), contrairement à vous (contrary to you)
- AP (adjectival phrase): très content (very happy), trois ou quatre (three or four)
- PP (prepositional phrase): chez lui, à Paris (in Paris), depuis mars (since March)
- VP (verb phrase): va à Paris (goes to Paris), tout lire (read everything), ne pas comprendre (to not understand)

4. The terminology

We propose a consistent and workable terminology, which takes linguistic results and generalizations into account. We try to keep existing terms, but redefine them with explicit linguistic properties.

We also define 11 grammatical relations (or functions) associated with words and phrases (see Table 3).

Our linguistic choices are based on modularity. POS are based on morphological and distributional criteria and are carefully distinguished from valence frames and from grammatical relations. In most French grammars and lexicons, these notions are not kept apart.

For example, in most lexicons, the form avant (before) receives at least three different POS: Preposition, when followed by an NP as in (3a), Adverb when used alone

- Sentence: Paul viendra (Paul will come), Quel plaisir ce cours (What a pleasure this class)! Tous dehors! (Everyone outside)

Table 3: Grammatical functions
(as in 3b), and Subordinating Conjunction when used with ‘que’, as in (3c). When it comes to verbs, a verb like attendre (wait) allows for the same continuations and does not change its POS (3d-f). We thus propose to have one word avant with one POS Preposition and three different valence frames: an NP complement, no complement or a sentential complement.

\[
(3) \quad \begin{align*}
\text{a) } & \text{Je viendrai avant le match (I’ll come before the game)} \\
\text{b) } & \text{C’était mieux avant (it was better before)} \\
\text{c) } & \text{Je viendrai avant que tu partes (I’ll come before you leave)} \\
\text{d) } & \text{J’attends (I wait)} \\
\text{e) } & \text{J’attends le match (I wait for the game)} \\
\text{f) } & \text{J’attends que tu partes (I wait for you to leave)}
\end{align*}
\]

We also keep POS separated from grammatical relations. Nouns for example can modify other nouns; this does not turn them into adjectives, as shown by the fact that they keep their gender, as maison in (4a), and possibly their number (4b). Similarly, adjectives may modify verbs; they are not analysed as adverbs because they lack a characteristic property of adverbs, which is to occur between auxiliaries and past participles without an intonation break; thus, the adjective net in (4d) contrasts with the adverb nettement in (4e).

\[
(4) \quad \begin{align*}
\text{a) } & \text{un sandwich maison (a home-made sandwich)} \\
\text{b) } & \text{un fichier clients (a file (for) customers)} \\
\text{c) } & \text{Paul a refusé net (Paul has refused flat)} \\
\text{d) } & \text{* Paul a net refusé} \\
\text{e) } & \text{Paul a nettement refusé (Paul has flatly refused)}
\end{align*}
\]

Grammatical relations are based on syntactic criteria rather than semantic ones. The subject relation for example is based on verb agreement, canonical preverbal position, the possibility of realisation by weak forms such as il and en, and the impossibility of realisation by other weak forms like on. Objects, on the other hand, are defined by the possibility of realisation by different possible weak proforms (le,la,les for definite objects, en for indefinite objects) and canonical postverbal position. With this definition, NP subjects can play different semantic roles; for example: agent for Paul in (5a), location for ce tiroir in (5b), goal for Paul in (5c). Postverbal NPs in (6a,c) on the other hand are analysed as objects, even though they correspond to the first semantic argument of the verb arrive in (6a) and of the infinitive in (6c), because it can be realised by en in the first case (indefinite), and by le in the second one (definite).

\[
(5) \quad \begin{align*}
\text{a) } & \text{Que lave Paul ? (What is Paul washing ?)} \\
\text{b) } & \text{Ce tiroir contient de l’argent (This drawer contains money)} \\
\text{c) } & \text{Paul a reçu des livres (P has received books)}
\end{align*}
\]

\[
(6) \quad \begin{align*}
\text{a) } & \text{Il arrive souvent des accidents (there often happen accidents)} \\
\text{b) } & \text{Il en arrive souvent} \\
\text{c) } & \text{Paul fait travailler son fils} (Paul makes his son work) \\
\text{d) } & \text{Paul le fait travailler}
\end{align*}
\]

**5. The structures**

Throughout the book, we use a simple phrase structure representation for all the constructions presented. We do not force binary branching structures, and use “flatter” structures than usually assumed, for example for tense auxiliaries (see Abeillé & Godard 2002 for discussion). Figure 1 shows the structures assumed for tense auxiliary constructions : a la Proust (has read Proust) and est allé à Rome (is gone to Rome).

![Figure 1: Tense auxiliaries](image)

We do not define Sentences by the usual NP-VP schema, which is too restricted to account for the data. We define sentences (the non elliptical ones) as saturated phrases with a predicative head. Accordingly, they may not have a syntactically realized subject nor a verbal head.

We follow Miller (1992) in analysing weak personal proforms as verbal affixes, that leads us to simpler structures than usual for certain sentences. An imperative clause with a proform complement (such as regarde-le ‘watch him’) is a sentence reduced to a verbal head. An interrogative clause with a postverbal proform subject (such as comment va-t-il ? how is he going’) can be reduced to an extracted adverb and a verb (Figure 2).

![Figure 2: Weak proforms as affixes](image)

We also analyse as sentences (clauses) certain verbless utterances, with a propositional meaning, and a non verbal head. Figure 3 shows the structure associated with an interrogative clause with an adverbial head Combien le café ? (How much for the coffee ?) and a clause with a prepositional head, with the pragmatics of an order Les petits en scène ! (the small ones on stage !):
For the sake of simplicity, we do not use feature structures. The only complications we allow ourselves is the annotation of the branches of the trees with the grammatical relations, (see figures 1, 2, 3) and referential indices, to indicate similarity or difference of reference. There are few places where this choice raises a difficulty. One is the case of antecedentless relative clauses (7). The first phrase is a wh-phrase which functions both as the antecedent of the relative clause and the extracted phrase in the relative clause. Thus, if the extracted phrase corresponds to a PP in the relative clause, it is only acceptable if the same PP is required in the matrix clause (hence, the contrast between (7b) and (7c)).

\[(7) \quad \text{a} \quad J'ai rencontré [qui m'avait invite] (I met who had invited me)  
\text{b} \quad J'ai discuté [avec qui tu avais discuté] (I discussed with whom you had discussed)  
\text{c} \quad *J'ai rencontré avec qui tu avais discuté (I met with whom you had discussed)\]

We can represent this structure as a fragment : a structure without a head (as answers often are, as in When will you be here ? – Tomorrow). Thus, the matrix PP directly dominates a relative clause whose extracted constituent is also a PP. But, to express the fact that one phrase plays two roles, it is necessary to use either feature structures, or to allow a representation which is not strictly a tree, since an expression can be dominated by several (two) branches (as do Huddleston and Pullum 2002).

6. The databases

We define several lexical databases, for closed classes of grammatical words (like complementizers, determiners), for certain valence frames (subjectless verbs, verbs with a predicative complement), and for certain semantic classes (degree and associative adverbs, locative prepositions). An example is Table 4 which gives an exhaustive list of French determiners. Note that we include some originally complex expressions which have evolved into lexemes.

| Determiners |  
| --- | --- | 
| definite | Ce, le, lequel (relative, interrogative), son  
| Indefinite and quantifiers | aucun, un, un de ces (+ Nsg), un certain, certains, chacun, chaques, de, de ce, de son, du, nul, plusieurs, quel, quelque (sg), zéro, je ne sais quel / lequel, on ne sait quel / lequel  
| Free choice items | nimporte quel, tout |

Table 4: French determiners

The other items which can combine with a Noun to form a Noun Phrase are adjectives (cardinals, indefinites such as quelques and adverbs (degree quantifiers such as beaucoup). Adjectives may combine with determiners (8a,b) whereas determiners are defined as non combining with one another (8c)). Adverbs, contrary to Determiners, may not combine with unmarked Nouns, and must be followed by de (8d,e) (a preposition used with the marker function):

\[(8) \quad \text{a} \quad Mes trois chats (my three cats)  
\text{b} \quad Ces quelques fleurs (these few flowers)  
\text{c} \quad *Ces mes chats (these my cats)  
\text{d} \quad *Beaucoup chats  
\text{e} \quad Beaucoup de chats (many cats)\]

Another example is Table 5 which gives an exhaustive list of non reflexive verbs taking tense auxiliary être in standard modern French.

| Only être | advenir, aller, (ré)apparaitre, arriver, décéder, (re)devenir, intervenir, naître, (re)partir, parvenir, provenir, rester, (re)venir, survenir, mourir  
| Étre in intransitive use | (re)monter, (re)entrer, (re)descendre, (re)sortir, retourner, rentrer, tomber  
| Free alternation between être and avoir | accourir, demeurer, (dis)convenir (de), éclore, échapper, échoir, expirer, passer, (dis)paraître, résulter (de) |

Table 5: Non reflexive verbs taking auxiliary être in standard French
agentive intransitive verbs (Marandin 1999):

(9) a. Jean a lavé le chien (Jean has washed the dog)
b. Jean s’est lavé (Jean has washed himself)
c. Jean est parti / mort (Jean has left/died)
d. Un train a/est passé (a train has passed)

Another type of database is devoted to certain polymorphic grammatical words, which are notoriously difficult to analyse. Table 6 shows our analysis for the form *que*, which can correspond to a Proform, to a Complementizer or to an Adverb.

<table>
<thead>
<tr>
<th>POS</th>
<th>Examples</th>
