Comparison, similarity and simulation in Zaar, a Chadic language of Nigeria

Bernard CARON
Llacan* (Inalco-CNRS, PRES Sorbonne Paris-Cité)
Fédération « Typologie et universaux linguistiques : données et modèles » (FR 2559)

I. Introduction

This paper discusses the linguistic expression of similarity, aka ‘similative’ in Zaar, a Chadic language spoken south of Bauchi State, in Northern Nigeria. As the Zaar similative is related to other functional structures, both morphologically (e.g. equative, simulative), or cognitively (e.g. comparison of superiority, aka ‘comparative’), these will also be included in the discussion. After a presentation of Zaar and its typological characteristics, stressing the fact that the predicative words expressing the standard of comparison in Zaar are essentially verbs, not adjectives (Section 2), the paper does a quick morpho-syntactic survey of the general cognitive operation of comparison (Section 3), showing how the equative, simulative and simulative structures are based on the preposition ɗan, ‘like’ whereas the comparative structure centers on the verb mop, ‘surpass’. Section 4 studies the comparative, while Section 5 focuses on the preposition dan and its morpho-syntactic status in relation with the equative and the similative structures. Section 6 shows how the morphemes dan, ‘like’, the quotative tu, and the particle ku combine to form the simulative marker ɗan (ku)tu. Finally, Section 7 summarises the contribution of Zaar to the study of comparison and similarity.

II. Zaar, a South-Bauchi Chadic language

Zaar, also known as Saya, is spoken by about 150 000 speakers in the South of Bauchi State (Nigeria), in the Tafawa Balewa and Bogoro Local Government Areas. Together with 30 or so other related languages first identified by (Shimizu 1978), Zaar forms a sub-branch of West Chadic languages named the South-Bauchi languages. Apart from the dominant languages, i.e. English (official national language) and Hausa (dominant all over Northern half of Nigeria), South Bauchi languages are surrounded by Niger-Congo

1 Most of the examples quoted are extracted from a one-hour corpus published by the CorpAfroAs project (Mettouchi, Vanhove, & Caullet 2012), and completed by a two-hour corpus transcribed and annotated with the help of Marvellous S. Davin in November 2012 in Nigeria during a fieldtrip funded by IFRA-Nigeria and the EFL LABEX programme “The Typology and Corpus Annotation of Information Structure and Grammatical Relations”.

Transcription: Zaar is a 3 tone languages with High and Low noted respectively (á) and (ã), and Middle left unmarked (a). Contour tones are Rising (ǎ) and Falling (â). In the examples, the first line gives a broad phonemic transcription, with post-lexical tone realization and segmental assimilations, and the second line gives a morphological analysis. For interlinear glossing, we follow the Leipzig Glossing Rules (Bickel, Comrie, & Haspelmath 2008) adapted for the CorpAfroAs project. Abbreviations. 1.2.3: 1st, 2nd, 3rd person; AOR: Aorist; COP: Copula; CPL: Completive; CTP: Centripetal; DEM: Demonstrative; EMF: Emphatic; EQ: Equative (copula); FUT: Future; ICPL: Incompletive; IMM: Immediate past; INCH: Inchoative; INDF: Indefinite; IRR: Irrealis; NMLZ: Nominaliser; NP: Noun Phrase; OBJ: Object; OPN: Opener (reported speech); PL: Plural; POS: Possessive; POS: Incompletive; PP: Prepositional Phrase; PRO: Pronoun; PROX: Proximate; PTCL: Particle; QL: Qualitative (copula); QLT: Qualitative (modifier); REL: Relativiser; RES: Resultative; S: Sentence; SBJV: Subjunctive; SG: Singular; SVC: Serial Verb Construction; SVO: Subject-Verb-Object; V: Verb.

2 (Newman 1990) classified South-Bauchi languages as the B3 sub-branch of West Chadic. (Newman 2006; 2013) now treat these languages as a third sub-branch (West-C) within West Chadic.
languages in the West (Izere, Birom); in the East (Jarawan Bantu³); in the South (Tapshin, Fyem, Kwanka) and further South-East (Tarok). Two isolates inside South-Bauchi languages are Bankal in the North and Boi in the South.

Four dialects can be distinguished within Zaar, named after the main villages or towns where they are spoken: Bogoro (formerly called the Lusa dialect), Gambar Lere, Marti and Kal. The Kal dialect is very close to what is generally called the Sigidi or Gu:s language, so much so that Gu:s can be conflated with the Kal dialect of Zaar (cf. Caron 2001).

Most Zaar people of the younger generation are Hausa-Zaar bilinguals. They are schooled in Hausa in primary school, before learning English. The Zaar are Christians and use a Hausa translation of the Bible. The older generation are not fluent in Hausa, whereas the younger educated elite, who often hold positions in the administration, police and education, switch comfortably between Zaar, Hausa and English.

From a typological point of view, Zaar shares with its Hausa ‘big brother’ the main characteristics of most Chadic languages: it is a SVO head-first language where TAM is conflated with the exponent of the subject function into a pre-verbal pronominal clitic. Contrary to Hausa, this pre-verbal complex does not include the expression of focus. This same portmanteau morpheme can be omitted in sequential clauses – a phenomenon different from subordination, and appearing in narration to indicate consecutive events – and in Serial Verb Constructions (more on SVC in section 4 on the comparative). Zaar uses prepositions and the genitival modifier follows the noun it modifies. There is no case marking of object and subject. Zaar does not use relative pronouns, but has a relative subordinator dan, different from interrogative pronouns, which will be discussed in Section 7. Qualification is expressed either by a limited set of adjectives referring to age, size and colour, or more commonly by verbal predication, and more precisely by quality verbs. This preference for verbal predication of quality is manifest in comparison.

III. A brief overview of comparison in Zaar

The linguistic expression of similarity, or simulative, is part of the broader conceptual category of comparison. Comparison presupposes an entity, called the comparee, in relation with some property, state or, more rarely, a dynamic state of affairs. The comparee is the argument of a predicative word – most often an adjective – representing a parameter of comparison applied to it, relative to some standard.

“The comparative degree of some predicate – typically an adjective – marks this predicate as applying to its argument (the comparee) to a higher extent than the standard; e.g. smaller. […] A comparison of equality is one that ascribes to the comparee the same value of the parameter of comparison as to the standard.” (Cuzzolin & Lehmann 2000, 1212 ff.)

In the comparative degree, some languages mark a difference between the comparison of superiority (more intelligent than) and the comparison of inferiority (less intelligent than). In Zaar, such a contrast does not exist, and the comparison of minority is expressed through the negation of the comparison of equality (not as intelligent as).

As a consequence, we will focus on the comparison of equality (generally called ‘equative’ in typological studies) and the comparison of superiority, which, likewise, we will call ‘comparative’ for convenience sake.

---

³ The name Jar, or Jarawa is misleading since it refers to different populations, speaking different languages: the Jarawan Dutse (Mountain Jars) speak Zarek (Zere, Zarek, Afizere, Ifizere), a Benue-Congo language, and the Jarawan Kogi (Plain Jars), speaking Jààr (Zhar), a Bantu language, commonly called Jarawan Bantu. Finally, the Jerawa are another population, speaking Zele, a Benue-Congo language from the Kainji group (Shimizu 1975).
A good starting point for the typological study of comparison is given by English, with a clear morphology expressing the various logical articulators of comparison, such as (Haspelmath & Buchholz 1998)’s descriptive framework for the study of equatives and similatives, which we will use for this work on Zaar:

(1) **EQUATIVE**

My sister is as intelligent as you.

<table>
<thead>
<tr>
<th>Comparee</th>
<th>Parameter</th>
<th>Marker</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Parameter</td>
<td>Standard</td>
</tr>
</tbody>
</table>

The same framework can be adopted for the comparative:

(2) **COMPARATIVE**

My sister is more intelligent than you.

<table>
<thead>
<tr>
<th>Comparee</th>
<th>Parameter</th>
<th>Marker</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Parameter</td>
<td>Standard</td>
</tr>
</tbody>
</table>

This first dimension of contrast (equality vs. inequality) intersects with the contrast between scalar and non-scalar comparison (Huddleston & Pullum 2008, 1099 ff.), producing the different types of comparison in (3) below:

(3)  

<table>
<thead>
<tr>
<th></th>
<th>equality</th>
<th>inequality</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>equative (as ... as)</td>
<td>comparative (more ... than)</td>
</tr>
<tr>
<td>non-scalar</td>
<td>identity (same as) similative (like)</td>
<td>difference (different from)</td>
</tr>
</tbody>
</table>

This contrast between scalar and non-scalar comparison has been used in the literature, although in different terms, to explain e.g. the difference between equatives and similatives:

“Semantically, the difference between equatives and similatives is not so much that similatives express approximate similarity, while equatives express true equality, but rather that similatives express identity of manner, whereas equatives express identity of degree or extent, or in other words, similatives express quality while equatives express quantity.” (Haspelmath & Buchholz 1998, 313)

These five types of comparison are basically expressed as follows in Zaar:

(4)  

<table>
<thead>
<tr>
<th></th>
<th>equality</th>
<th>inequality</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>equative: dan, ‘like’</td>
<td>comparative: mop, ‘exceed’</td>
</tr>
<tr>
<td>non-scalar</td>
<td>identity: nambón, ‘one’ similative: dan, ‘like’</td>
<td>difference: mari, ‘different’</td>
</tr>
</tbody>
</table>

As can be seen in table (4), there is a strong resemblance between the equative and the similative, both expressed through the preposition dan, ‘like’, as opposed to the expression of the comparative through the verb mop, ‘exceed’, while identity and difference are lexicalised through the use of the numeral nambón, ‘one’ and the adjective mari, ‘different’ respectively.

The identity of the preposition dan, ‘like’ needs further consideration, taking into account the possible links with three other words and their variants: the adverb dan (var. da’), ‘again’; the relative subordinator dan (var. da), ‘that’; and the deictic adverb dán (var. dâni), ‘there’.

---

4 Nasal phonetic variants are common in Zaar; e.g. the variation of the morpheme kutu/kutun, ‘as if’. (cf Section 8).
The tonal, morphological and semantic differences between the deictic adverb *ɗâni* and the similative preposition *ɗân*, ‘like’ are too important to consider them to be either variants of the same word or to be otherwise related.

In the same way, although relative markers are often derived from deictic determiners in Chadic languages (Frajzyngier 1996), the falling prosody and the adverbal function of *ɗân* militate against its relationship with the relative subordinator *ɗân*. In Section 7, we analyse the relative and temporal clauses as complements of the preposition, and the relative and temporal subordinator *ɗân* as a grammaticalisation of the similative preposition *ɗân*, ‘like’.

Finally, the cognitive relationship between repetition and identity or similitude argues in favour of a lexical connexion with the adverb *ɗâni*/*ɗân* ‘again’:

(5) *Máman sumi yá daːli gón *ɗâni.*

 má mán su =mí ká dɔːl -i gón *ɗân*

1PL.FUT come return =1PL.OBJ at open space -INDF QLT again

We will go back to another [tale] again (SAY BC NARR 01 SP1 001).

However, the grammaticalisation path is not clear from the clause-final adverb *ɗâni* to the homophonous preposition *ɗân*. The relative scarcity of documentation of related Chadic languages concerning similitude and comparison makes it difficult to get any extra information that would help. The only related lexeme is found in Miya with the verb *ɗám(à)*, ‘equal, reach, be as…’, contrasting with the verb *rà*, ‘exceed’. (Schuh & Ciroma Tilde Miya 2010) There exists no such verb in Zaar, which would contrast with *mop*, ‘surpass, exceed’ (cf. Section 4). It is tempting to imagine that such a verb *ɗan* has existed, and given birth to the preposition *ɗân*, ‘like’ and the homophonous adverb *ɗân*, ‘again’ before disappearing. Unfortunately, nothing more can be said concerning a possible etymology or grammaticalisation path for all the uses of *ɗân*.

Before moving on to the following sections for the study of the comparative (Section 4) and the equative/similative (Section 5), let us see how identity and difference are expressed through the adjectives *nàmbón*, ‘one, single’ (Ex. 6) and *mari*, ‘different’ (Ex.7):

(6) *Tá wáːni miːtsɔ nàmbóŋ?*

 tá waː -ni miːtsɔ nàmbón

3PL.FUT perform INCH burial one

Will they do the same funeral? (SAY BC INT 02 SP2 40).

(7) *Maːndo séː tó póldi yá dàtɔpí wón mari.*

 maːndo séː tó pol -dí ká dàtɔpí -i wón mari

fight only if 3SG.SBJV go out CTP at road -INDF QLT different

Fighting must arrive in a different way. (SAY BC INT 05 Morals SP1 149).

### IV. Comparative

The comparative (comparison of superiority) in Zaar is based on the verb *mop*, ‘surpass, exceed’, a labile verb which can be intransitive, monotransitive or ditransitive. The basic transitive use of the verb is exemplified in (8).

(8) *Káːdáː lyá dúː tó móp karfíwâːn.*

 káːdáː àː lya dúː tó móp karfì =wâːn

NEG3 2SG.SBJV drink beer 3SG.SBJV surpass strength 2PL.POS

5 The verb ‘surpass' is the frequent means in African languages from various families to code comparison of superiority.
Don’t drink more beer than you can stand. [lit. Don’t drink beer so that it should exceed your strength]. (SAY BC INT 05 Morals SP1 035).

The intransitive use of mop expresses set comparison (comparative of absolute superiority):

(9) Gjò: γɔndà wɔ mop deːdɛjo:?
   gjò: =kɔndà wɔ mop deːdɛ: o:
   which =COP2 3SG.FUT surpass exactly EMPH
   Which one will be most suitable? (SAY BC CONV 01 SP2 021-2).

This verb is used in two different strategies for comparison in Zaar: the Serial Verb Construction Strategy, and the ditransitive strategy.

A. Serial Verb Construction Strategy

Looking superficially like the equative/similative structure (see Section 5 below), the comparative use of the SVC is exemplified in (10) below:

(10) Á: wɔ colák mop kɔ.
   â: wɔ gəlák mop kɔ
   ah 3SG.FUT be smooth surpass 2SG.OBJ
   Eh, he will look nicer than you. (CONV 02 SP1 111)

Although it appears in the same position as the preposition dan, ‘like’ of the equative/similative structure, mop is a verb: kɔ in (Ex.10) is a 2nd person singular Object Pronoun, belonging to the paradigm of verb complement pronouns, whereas prepositions in Zaar take Independent Pronouns as complements, e.g. dan kyáːni, ‘like you’. This comparative structure uses a Serial Verb Construction (SVC) strategy, as characterised in (Aikhenvald & Dixon 2006, 1):

“A serial verb construction (SVC) is a sequence of verbs which act together as a single predicate, without any overt marker of coordination, subordination, or syntactic dependency of any other sort. Serial verb constructions describe what is conceptualised as a single event. They are monoclausal; their intonational properties are the same as those of a monoverbal clause, and they have just one tense, aspect, and polarity value.”

In this construction, the first verb (gəlák, ‘be smooth’) is the major verb, an intransitive quality verb which functions as the comparative predicate, and expresses the parameter. The second verb (mop, ‘surpass’), is the minor verb, and functions as the standard marker. It is a transitive verb which takes the standard as a direct object. The resulting structure is shown in the table below, with the translation of ‘Mopshi is taller than Deندà’:

<table>
<thead>
<tr>
<th>Comparee</th>
<th>Parameter</th>
<th>Standard Marker</th>
<th>Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>NP</td>
<td>PRO V₁</td>
<td>V₂</td>
<td>NP</td>
</tr>
<tr>
<td>Mopshi</td>
<td>á lũː</td>
<td>mop</td>
<td>Dènda</td>
</tr>
</tbody>
</table>

Mopshi is tall surpass Deندà

There exist ‘true’ adjectives Zaar, but they don’t appear in comparisons where synonymous quality verbs are used, e.g. lar ‘be red’ is substituted for ‘ʒa’, ‘red’.
The subject pronoun of the major verb (Parameter) can be repeated before *mop*, ‘surpass’ (the second verb, and Standard Marker), e.g. in (Ex.12):

(12) \(\text{Ko gyi vi: ko mop yeli.}\)

\[
\begin{array}{ll}
\text{2SG.AOR} & \text{eat speech} \\
\text{mop} & \text{surpass bird}
\end{array}
\]

You are more talkative than a bird. (SAY BC READ 03 Sermon 272)

**B. Ditransitive strategy**

The ditransitive strategy is the only one available for parameters expressed by non-verbal predicates. The comparative predicator *mop* remains as the single main verb, with the standard as the first object, and the parameter as the second object.

(13) \(\text{Na gyö: yöŋ á mop kämfi dáyro.}\)

\[
\begin{array}{ll}
\text{COP1 which} & \text{mop 3SG.AOR surpas s friend -PL -INDEF madness EMPH}
\end{array}
\]

Who is more stupid than his friends? (lit. ‘who surpasses the friends (in) madness?’) (SAY BC READ 08 NAR Men-Naar 38)

The resulting structure is as follows:

(14) | Comparee | Standard Marker | Standard Parameter |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>NP</td>
<td>Pro V</td>
<td>NP&lt;sub&gt;1&lt;/sub&gt; NP&lt;sub&gt;2&lt;/sub&gt;</td>
</tr>
<tr>
<td><em>Mopši</em></td>
<td><em>mop</em></td>
<td><em>Dända</em> <em>gya:l</em></td>
</tr>
<tr>
<td>Mopshi</td>
<td>surpass</td>
<td>Dœndà</td>
</tr>
</tbody>
</table>

The same structure can be used with a parameter expressed by a nominalised verb:

(15) \(\text{Di:la mòp Zàn:kì sayátkùnì ö:}.\)

\[
\begin{array}{ll}
\text{Dǐ:la mop Zà:kì sakát -kùnì -ö:}
\end{array}
\]

Jackal surpass Lion be clever -NMLZ EMPH

Jackal is more clever than Lion (lit. Jackal exceeds Lion in being clever).

The parameter is omitted when it can be contextually recovered, as in (Ex. 16), a question typically concluding tales describing a competition among a group of friends, and for which there exist two varians in the corpus, with and without the parameter *kù:skùnì*, ‘being evil’:

(16) \(\text{Na nú: yöŋ á mòp kämfi (kù:skùnì ö:).}\)

\[
\begin{array}{ll}
\text{COP1 who} & \text{mop 3SG.AOR surpas s friend 3SG.POS be evil NMLZ EMPH}
\end{array}
\]

Who is more evil than his friends? (SAY BC READ 09 36)

Mupun, another Chadic language from the Angas family spoken south of Zaar, uses the same structures to express comparison, e.g. (Ex.17) for the Serial Verb Construction strategy:

(17) \(\text{nàløŋ ret met damuan}\)

Nalong pretty surpass Damuan

Nalon is prettier than Damuan
The second complement of the ditransitive strategy is prepositional in Mupun, e.g. (Ex.18):

(18) *damuan met naloŋ n-ret*

Damuan surpass Nalong PREP-beauty

Damuan is more handsome than Nalon (Frajzyngier 1993, 247)

V. Equative/Similative structure

A. Equative

The basic structure of the equative is exemplified in (Ex. 19):

(19) *Tâ:s Dœnda ə njiró dan fêmđi.*

<table>
<thead>
<tr>
<th>ūs</th>
<th>dœnd</th>
<th>á</th>
<th>ndjir</th>
<th>dán</th>
<th>fêm</th>
<th>d</th>
</tr>
</thead>
<tbody>
<tr>
<td>hand.POS</td>
<td>Dœnd</td>
<td>3SG.AOR</td>
<td>be cold</td>
<td>like</td>
<td>ice</td>
<td></td>
</tr>
</tbody>
</table>

Dœnd’s hand is as cold as ice.

This structure can be represented as follows:

(20) Comparee Parameter Standard Marker Standard

<table>
<thead>
<tr>
<th>NP</th>
<th>Pro V</th>
<th>Prep</th>
<th>NP</th>
</tr>
</thead>
<tbody>
<tr>
<td>tâ:s Dœnda</td>
<td>á njiró</td>
<td>dán</td>
<td>fêmđi</td>
</tr>
</tbody>
</table>

It should be noted that the equative in Zaar does not use a parameter marker. Due to the dominantly verbal nature of the expression of quality in Zaar, the comparative predicate which includes the parameter is a quality verb, e.g. *lûː*, ‘be tall’; *ʧolák*, ‘be smooth’; *saɣat* ‘be wise’, etc.

B. Similative

In English, the difference between the similative and the equative lies in the absence of parameter marker and the use of *like*, a standard marker that is different from the equative *as*. Since the Zaar similative uses the same standard marker as the equative (i.e. *dan*), and the equative does not have a parameter marker either, the same structure is used for the equative and the similative:

(21) *Á fi ma:ndo dan zâ:ki.*

á fi ma:nd| dán zá:ki.

3SG.AOR do fight like lion.

He fights like a lion.

The only difference lies in the scalar property of the comparative predicate. If it is scalar (e.g. *luː*, ‘be tall’; *sayât*, ‘be wise’), the structure will be interpreted with an equative meaning. If it is non-scalar (*fi ma:ndo*, ‘fight’), it will take a similative meaning. See (Section 6) below for more on this opposition between the similative and the equative.

---

7 There exist ‘true’ adjectives Zaar (cf. (Ex.13), *yîr djêː*, ‘black eye’), but they don’t appear in comparisons where synonymous quality verbs are used instead, e.g. *lar* ‘be red’ is substituted for ‘*zaː*’, ‘red’.
C. Morphological status of the parameter marker ɗan

ɗan is followed in Zaar by different types of constituents, i.e. Noun Phrases, Prepositional Phrases and Clauses. If, as a consequence, it is analysed as changing its lexical category with each context, i.e. as preposition or conjunction, this results in a multiplication of the syntactic functions of ɗan. Instead, using Ockham’s razor, and inspired by the discussion of English than by (Huddleston & Pullum 2008, 1103), ɗan is here analysed as a preposition taking NP, PP and S-complements:

(22) NP complement, e.g. Mopţi, a proper noun.

Ɗàndà á wà: ʤàr ɗàm Mopshi

Ɗàndà á wà: ʤàr ɗàm Mopshi

Ɗàndà danced like Mopshi.

(23) PP complement, e.g. dàgà Pùjì, ‘from Tafawa Balewa’

Rì:ɣà ɗàgà zùwa Zùwà:ɪ dàdàn á ʧ: ɗàgà Pùjì

ri: -kàñi dàgà zùwa Zùwàl dàdàn á ʧ: -i:

walk -NMLZ from around Zwál there 3SG.AOR do -RES

ɗàgà Pùjì

ɗàgà like from Tafawa Balewa

The walk from Zwal there, is like from Tafawa Balewa (CONV03 SP1 206)

(24) S (clausal) complement, e.g. á túl:i; ‘he arrived’.

Ɗàn á túl:i: á lón tu volàŋ gùŋ á: ʧ:

ɗàn á lón tu volàŋ gùŋ á: ʧ:

like 3SG.AOR reach RES 3SG.AOR go and get
volàŋ - gùŋ á: ʧ: -i:

groundnut POS chief 3SG.CPL do RES

When 8 he arrived, he found that the King’s groundnuts were ripe. (SAY BC READ 06 NAR Longa 053)

VI. Semantics of the Equative/Similative structure

Depending on the semantic and discursive contexts, the equative/similative structure with ɗan will take various meanings. Phrasal complements will induce equative or similative interpretations (both specific and general), as well as a functive interpretation. Clausal complements will induce similative, accord and substitutive meanings.

At phrase level, ɗan appears in exactly the same structure with equatives and similative functions. The difference is due to the semantic nature of the comparative predicator, i.e. the parameter. A scalar parameter will induce an equative interpretation (Ex. 26 & 27); a non-scalar parameter will induce a similative interpretation (Ex. 28). The opposition specific vs. general depends on the specificity of the standard. See (Ex. 26 & 27) for a contrast between specific and general equatives.

---

8 See (Section 7.1) for this use of ɗan introducing a temporal adjunct.
9 We have no example of the structure being interpreted as a simile, but there is no reason why it should not.
A. Specific equative

In the following example, the scalar parameter is the quality verb *luː*, ‘be tall’; and the standard is a referential, individual item against which the comparee is set, i.e. *Dœnَا*, a person:

(25)  
Mopshi á luː dan Dœnَا.

Mopshi 3SG.AOR be tall like Dœnَا

Mopshi is as tall as Dœnَا.

B. General equative

The following example, a stock Zaar insult, is a general equative where the scalar parameter is the quality verb *ɓaŋ*, ‘be bitter’. The non-specific standard producing a general equative is *ránga*, ‘mahogany’, which stands for the abstract, highest degree of bitterness (a synonym of wickedness).

(26)  
Kə báŋ dan rānga.

2SG.AOR be bitter like mahogany

You are as wicked as the Devil. (Caron 2005, 9)

C. Similative

In (Ex.27) the similative meanings are produced by the two non-scalar parameters, viz. the action verbs *kítâr*, ‘run’ and *ɬə*, ‘go to’.

(27)  
Tôː yô dingā kítâr dan düːn hár yô liːː dan Wûːr Viŋ.

tô: 2PL.AOR continue running like here up to 2PL.AOR go RES

dân wûːr - Viŋ
like mountain POS Vung

then you would start running like here till you go to... like the Vung Mountain (SAY BC INT 03 Calendar SP1 358-360)

The same similative meaning appears when the standard is expressed by a clause:

(28)  
Clause level similative: Parameter = S = *Mopshi wâː ngîl*, ‘Mopshi sang’.

Dœnَا á wâː tʃâr dan Mopshi wâː ngîl.

Dœnَا 3SG.AOR do dance like Mopshi do song

Dœnَا danced like Mopshi sang.

Here, the clausal complement of the preposition *dan* exhibits some morphosyntactic reduction with the bare verb *wâː* appearing without repeating the Subject-TAM complex á of the matrix clause.

D. Functive

Another function of the structure equative/similative structure is that of role phrase (Haselmath & Buchholz 1998), also called functive (Creissels 2011), where the NP introduced by *dan* works as a secondary
predication expressing 'the role or function in which a participant appears' (Haspelmath & Buchholz 1998, 321-4). Only one example of role phrase was found in the corpus:

(29)   No myːni yəŋ mə mán ni dán ndwáːtsə mə gəm longa tu āː lágːp.
      COP1 1SG.IDP COP2 1SG.AOR come like old person
      mə gəm longa tu āː lágːp
      1SG.AOR release rabbit COMP 2PL.SBJV follow

"I am the one who came (disguised) as an old man and released rabbits for you to follow. (SAY BC READ 12 NAR Kadi gi kitn 063-5)

E. Substitutive
A noticeable case of semantic inversion is observed in substitutive clauses: the preposition dán and the structure of the substitutive clause is identical to that of the similitative. With the proper context, and without changing anything to the structure, the preposition dán takes a substitutive meaning ('instead of'). In the following example, the substitutive interpretation is induced by the 2sg.Aorist ko used with the verb páːr, ‘thank’ instead of the Completive usually associated with this verb:

(30)  Context: [you saw something worthless,] you went and took it too, instead of thanking God [for what you had already.]
      ko liːda ngápkən dán ko páːr ꦷọŋŋ
      ko tə -iː də ngaŋ -kəni dán ko páːr ꦷọŋŋ
      2SG.AOR go RES again catch NMLZ like 2SG.AOR thank God

you went and took it too, instead of thanking God (SAY BC READ 05 Song Swari 162)

F. Accord clause
Accord clauses are not distinct formally from other clausal structures using dán as a standard marker, as can be seen in (Ex. 31 & 32) below.

(31)   Gədːiː ləŋ fi dəŋ gədːiː ꦷuː tə .
      gət -iː ləŋ fi dán gət -iː fiː =tə like woman -RES go do =3S.OBJ
      woman -RES go do like woman -DIST tell =3S.OBJ

That woman went and did as that [other] woman had told her. [2012-11 like 21 #19/168]

(32)   Dən mənːəː fuː yə nə yəː wòŋ myːː səː āː gəmːə ləː mːiː yəndːə āː tə .
      dán mənːəː fuː =kə nə yəː wòŋ məː yːː səː āː gəmːə laː -nː -nː -iː like 1SG.REC tell =2SG.OBJ yesterday 1SG.ICPL want
      2SG.SBJV finish work -PROX -INCH -DIST
      kəndːə āː tə .
      then 2SG.SBJV go .

As I told you yesterday I want you to finish that job before you leave the town. [2012-11 SIM 12]

Their function as manner rather than temporal adjuncts, or frame-setting topics (cf. Section 7 below) derives only from the semantic or informational context.
VII. Grammaticalisation of the equative/similative structure

When followed by a clausal complement, the semantic drift of the preposition can lead on to more grammaticalised meanings, e.g. when used to introduce temporal adjunct clauses, relative clause, and finally, at discourse level, topics.

A. Temporal adjunct

The preposition *ɗan*, ‘like, as’ can function with a clausal complement as a temporal adjunct. The resulting meaning is that of approximate simultaneity between the matrix clause and the adjunct clause.

(33) *Katáyá: fi wúr yá lá: pkɔn* *ɗan kɔ fà:rà ndàyən à lá: pkɔn?*

<p>| | | | | | |</p>

<td>ndáyən</td>
<td>ká</td>
<td>láː p</td>
</tr>
</tbody>
</table>

How did you practice your faith when you converted to Christianity (lit. when you started following)? (SAY BC INT 05 Morals SP2 47)

This temporal transposition of the comparative meaning of *ɗan* is quite common in other languages of the world, and is observed e.g. in English *as*, or in French *comme*, as in the opening verse of Arthur Rimbaud’s *Le Bateau Ivre*:

(34) *Comme je descendais des Fleuves impassibles,*
*Je ne me sentis plus guidé par les haleurs:*
‘As I was floating down unconcerned Rivers,
I no longer felt myself steered by the haulers:’ (Rimbaud 2009, 162)

The discursive function of temporal frame-setting, derived from the semantic interpretation of broad simultaneity, can also be narrowed down to a more precise temporal relationship between two events, such as concomitance, which involves both simultaneity and succession: ‘just as S…; after S, then...’. This occurs very often in the discursive context of a narration, characterised by such TAMs as the Aorist (narrative), or the Remote Past:

(35) *Dan à tãhː dì bafí sày Zhí: wúl fi tu […]*

When he [Dog] arrived near them [the monkeys], then Panther told them to… (SAY BC READ 13 NAR Gung-Meer 013-4)

B. Topicalisation and frame-setting

*Dan* appears with non-clausal complements in left-dislocated position where the resulting phrase functions as a topic. *Dan* can then be considered as having been grammaticalised into a topic particle, e.g. in (Ex. 36)

---

10 This is not possible e.g. in French where *comme* used in temporal clauses requires the use of imperfective TAM’s, e.g. Present, Imperfect, and Pluperfect.
where dan is used with the topic particles âmá, ‘but’ and kàm, ‘indeed’, to introduce the contrasting topic ‘Godiya’, the name of a young boy taken as an example when discussing the various types of mourning ceremonies:

(36) Àmá dan gòːdiya kàm [...] tâ wàːni miːtsɔy gyâkgyâk kûrûm.

âmá: \[\text{àmá: dan gòːdiya kàm} \]
but \[\text{like Godiya indeed} \]
tâ waː -ni miːtsɔ -i gyâkgyâk kûrûm
3PL.FUT perform INCH burial INDF anyhow only

But like Godiya on the contrary […] they would only be wailing. (INT 02 SP1 367-73)

This left-dislocated position is favoured by temporal adjuncts in Zaar as in French (Ex. 34) above. The subordinate clause introduced by ñan appears then before the matrix and functions as a frame-setting adjunct:

(37) \[\text{Dàm miːyàː \[\text{Dàm miːyàː \[\text{Dàm miːyàː ñaːs to yàːyí, kíː yèl láː áyàː fi wuriː?} \]}

\begin{tabular}{|c|}
\hline
\begin{tabular}{l}
\text{Dan miːyàː:} \\
\text{ñaːs =tɔ} \\
\text{as ICPL.IMM.1SG tease =3S.OBJ =ANAPH -RES}
\end{tabular} \\
\text{kiː yèl láː áyàː fi wuriː?} \\
2SG.IMM see work 3SG.ICPL.IMM do how
\hline
\end{tabular}
\]

As I was teasing him about it, did you see what happened? (CONV 01 SP2 106)

C. Relative clause

Finally, the preposition ñan, ‘like’ has been grammaticalised into the default relative subordinator dan, which behaves like the English subordinator ‘that’.

(38) \[\text{Mô ñôl ñòpɔn dan mâ lɔyàːy.} \]

mà ñal ñòp wɔn ñan mâ lɔ =kây
1PL.SBJV look for place some REL2 1PL.FUT go =ANAPH

We should look for a place that we will go to. (CONV 01 SP2 028)

Alongside the temporal adjunct structure, this is another extension of the function of the preposition dan when it takes a clausal complement. In this case, the resulting prepositional phrase functions as a noun modifier.

It should however be noted that the Zaar relative subordinator dan is not a relative pronoun, has no relationship with interrogative pronouns, and does not mark the syntactic function of the modified noun within the relative clause. In (Ex.38) for example, the gap left by the relativised constituent lɔp, ‘place’ is filled by the locative anaphoric pronoun =kây. Consequently, although dan is used for both equative, simulative and relative structures, Zaar is characterised as using a preposition, and should not be included in the languages using a relative-based strategy.

VIII. Simulation

Before the final section which summarises the findings concerning comparison and similarity in Zaar, this section focuses on another use of the morpheme dan when combined with the quotative tu and/or another morpheme, ku, producing pretense clauses, or simulatives, with the meaning ‘as if…, as though…’. The most exhaustive combination is the form dan kutu e.g. (Ex. 39):
Dan kutu can be reduced to dan tu, e.g. (ex. 40) below:

(40) À fidan tu ma gôngá.

á fi =ma dan tu ma gôngá
3SG.SBJ.AOR do =1SG.OBJ like OPN 1SG.FUT vomit

I feel [lit. 'it does me'] as if I’m going to vomit. (CONV 03 SP2 255)

Dan kutu can also be reduced to kutu, eg. (ex. 41) below:

kì: yel lá: áyà: fi wuri: kutu wò ngwà:r
2SG.IMM see work 3SG.ICPL.IMM do how as if 3SG.FUT weep

Did you see what he was doing? As if he was going to cry. (CONV 01 SP2 107)

In the combination dan kutu, tu is identified as the introducer of reported speech. This morpheme could be a word originally meaning ‘say’ (<*t-; cf. Hausa ʧê:), which has disappeared in Zaar where the verb wul/wu is used instead. Tu is the default reported speech opener. It can appear alone, at the beginning of the sentence, without any other verb:

(42) Kə tu gi: nə ni?: — Tu nə kûŋ lù:

kə tu gi: nə ni: tu nə kûŋ lù:
2SG.AOR get DIST COP1 what? OPN COP1 dry meat

What have you found? He said it’s dry meat. (NARR 03 SP1 202)

Or it can follow a verb or phrase expressing an act of speech, thought, opinion, etc.:

dòn tə wu tu kə: suwa fi: yûkn -i: dangôñi
because 3PL.AOR say OPN market 3SG.ICPL fill -RES now

Because they say that now the market is really big. (CONV 01 SP2 040)

The quotative tu is also used to introduce a proper noun:

(44) Səm gón tu Kèrnêk:še, səm gón tu Dà:ğülâw, səm gón tu Vwà:gnî

səm gón tu kërñêk:še səm gón tu dà:ğülâw səm gón tu vwà:gnî
name some OPN Kerenkeshe name some OPN Dagulau name some OPN Vagani

One was named Kerenkeshe, one was named Dagulau, one was named Vagani. (NARR 02 SP1 004)
In the complex morpheme dan kutu the notion of simulation is associated more precisely with the morpheme ku. Ku is never used as an autonomous morpheme in Zaar, and is associated with no other function than the simulative. An equivalent can be found in Mupun, a geographically close language belonging to the Angas Chadic family. In Mupun, there are two preposition expressing non-scalar equality comparison: too, ‘as’, expressing similarity; and ko, ‘as if’, expressing simulation:

(45)  
\[ \text{wu le siap mopun '*too/ko ngu mopun sə}} \]  
3M speak Mupun as if person Mupun DEM  
He speaks Mupun as if he were a Mupun person. (Frajzyngier 1993, 283)

Another source for the notion of simulation can be traced to the association of dan, ‘like’ and tu, the reported speech opener. The combination of comparative and quotative as a strategy to express simulation and other related notions (pretense, hypothesis, or irrealis condition), seems to be a straightforward cognitive operation, as exemplified in (Ex.46) taken from Naija (Nigerian English Pidgin):

(46)  
\[ \text{lai se na ju bi mi, hau ju fo du dis ti pas səf ?} \]  
like OPN COP.EQ 2SG COP.QL 1SG  
how 2SG IRR do PROX.SG thing EMPH PTCL  
If you were in my place, how would you have done this very thing? (9JA WAR 12 001)

From these observations, it can be inferred that there exist two competing strategies to form pretense clauses in Zaar, which can also be combined: one involving the combination of the simulative dan and the quotative tu, and the other involving the “pure” simulative ku.

The way the simulative is expressed in Zaar reveals strong tendencies at work all over the language: borrowing from Hausa and other neighbouring languages; fusion between original Zaar strategies and borrowed strategies; and finally, cumulative use of all the available strategies: synonymous morphemes can be used individually or piled up in the same structure.

**IX. Conclusion**

As a conclusion, the main properties of the expression of similarity in Zaar can be summarised as follows. With reference to the descriptive frame set by (Haspelmath & Buchholz 1998), i.e. Comparee – Parameter Marker – Parameter – Standard Marker – Standard, the equative in Zaar does not have a parameter marker. Due to the dominantly verbal nature of the expression of quality in Zaar, the comparative predicate which includes the parameter is a quality verb. The comparison of superiority uses two competing strategies: a Serial Verb Construction Strategy and a Ditransitive Strategy, both based on the verb mop, ‘surpass, exceed’. Similitude and equality comparison share the same syntactic frame in Zaar, based on the preposition dan, ‘like’. There is no difference in Zaar between specific and general equatives or similatives. This same equative/similative structure based on the preposition dan is used for different functions: role phrases and accord clauses. Surprisingly, in the appropriate context, this simulative preposition can take the substitutive meaning ‘instead of’. Simulation is expressed in various combinations which can involve the simulative dan (or its Hausa equivalent kaman), with the quotative tu, and the specialised morpheme ku, probably related to Mupun ko. Finally, the simulative structure dan + clausal complement, has been extended to take on different grammatical functions that are more loosely connected to the original meaning of similarity: time adjunct (‘as, when’); relative clause. When combined with left-dislocation, the structure <dan NP> is used as a topic, and the structure <dan S> functions as a frame-setting adjunct.
From a typological point of view, the expression of comparison and similarity in Zaar is quite different from what has been characterised as the “Standard Average European” equivalent (Haspelmath & Buchholz 1998, 325-6). The three main differences are (i) the verbal nature of quality in Zaar; (ii) the absence of parameter marker; (iii) the non-relative/interrogative base of the standard marker, which in Zaar is a preposition expressing manner.

Finally, Zaar, a head-initial language, confirms the main typological claim of (Haspelmath & Buchholz 1998, 289): “in head-initial languages the order should be ‘parameter - standard marker – standard’, and in head-final languages the order should be ‘standard - standard marker – parameter’.”
