HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

CATHERINE TAINE-CHEIKH (Paris)

Qualification and comparison in Berber The verb-noun distinction and its fluctuations

Abstract

The world's languages generally distinguish between nouns and verbs. However, many do not have a specific class of adjectives with its own significantly different grammatical properties to set it apart from nouns and verbs. This is true of Berber which, in this respect, differs from Arabic. That being said, if one looks at the details, there is wide variety across Berber languages. Most have both “verbal” adjectives and “nominal” adjectives, with more or less marked secondary properties. Some have a small adjective class for describing certain core properties. Historically, these could reflect an earlier phase of Berber.

Keywords: Berber, qualification, adjective, syntactic categories, predicative vs attributive function

Introduction¹

One of the roles of all grammars is to identify a language's lexical classes. To do so, it is often crucial to determine whether the language has a specific adjectival class (see VOGEL & COMRIE, 2000). This is because although qualification and comparison are often expressed by adjectival lexemes, the latter are not necessarily distinct, from a functional perspective, from other lexemes (more particularly verbal and nominal lexemes), or, when there is a distinction, it is often hazy. Thus DIXON identifies five major language types (1999: 4) depending on how their grammars integrate adjectives. Based on BASSET's (1952) study, he states that the Berber languages belong to type (3), a rare type where:

“There is an open class of adjectives which has grammatical properties that are effectively the sum of those of noun and of verb — when an adjective occurs in a noun phrase it can take the same inflections as a noun, and when it occurs as head of a predicate it can inflect in the same way as a verb”.

Among Berber specialists the question of whether adjectives constitute a specific syntactic class is still being debated. Some authors, e.g. BENTOLILA (1981),

¹ The following abbreviations are used: ADJ ‘adjectival; adjective’, AOR ‘Aorist’, AS ‘Annexation State’, cj. ‘conjugation’, FS ‘Free State’, F ‘feminine’, GEN ‘genitive preposition’, IPFV ‘Imperfective’, M ‘masculine’, PFV ‘Perfective’, PL ‘plural’, PROX ‘proximal’, PTCP ‘participial suffix’, SG ‘singular’. The symbol ^ indicates that an assimilation has not been noted. All Mauritanian Zenaga data are from the author's fieldwork (see in particular TAINE-CHEIKH 2008).

consider that northern Berber does not have qualifying adjectives. Others such as CHAKER (1995) believe that in at least some Berber varieties, e.g. Kabyle, adjectives constitute a subclass within the noun class.

My goal here is to examine how the various units which translate the idea of qualification or assessment function. Beginning with the verb/noun distinction, I will explore the hypothesis of a possible continuum between these two extremes. I will also consider the hypothesis set forth by GIVÓN (1984: 52) whereby he posits that prototypical adjectives are “intermediate states” between verbs and nouns from the perspective of temporal stability (the *Time Stability Hypothesis*). It would indeed be interesting to establish whether semantic and grammatical hierarchies coincide, and whether, in both, adjectives show a tendency to occupy an intermediate position between the two extremes of both.

Below I reproduce the diagrams of WETZER (1996: 52), however I will study not only the predicative function of “adjectives” (the above author’s field of study) but also their attributive functions.

1. Verbal extreme

1.1. Purely semantic specificities

In all Berber languages there are lexemes which behave like verbs in morphosyntactic terms, but which also express physical or moral characteristics more in line with the idea of qualification. BASSET (1929) provides the following examples: *kəram* ‘be cold’ and *əbzəg* ‘be wet’ in Semlal Tashelhiyt; *urəy* ‘be yellow’ in the Rif (*wərrəy* for the Seghrouchen); *rəy* ‘be bitter’ in Metmata and the Aurès; *gužəl* ‘be an orphan’ and *təz* ‘be close’ in Kabylia; *iyar* ‘be dry’, *užzaf* ‘be black’, *ləmžəggən* ‘be lukewarm’ and *muzzu* ‘be roomy’ in Ahaggar; *ađen/aṭen* ‘be ill’ almost everywhere.

The values of the system’s two basic forms — Perfective and Imperfective — do

² As Creissels (2006: 200) notes, nouns, adjectives and verbs are all logically capable of expressing properties, but lexemes which express scalable and relatively general physical characteristics such as *big/little*, *fat/thin*, *long/short*, etc. “*tendent à fonctionner comme prototype de classes morphosyntaxiques d’adjectifs, de la même façon que les classes de noms et de verbes s’organisent autour de prototypes mettant en jeu respectivement les notions de personne humaine et d’événement*” (“tend to function as the prototype for the morphosyntactic class of adjectives, just as noun and verb classes are organized around prototypes referring respectively to the notions of person and event”).

not appear to fully coincide in all Berber languages, but “quality” verbs often have their own particularities, especially in the case of pure statives: “*l’inaccompli exclut l’état*” (“the imperfective excludes states”) (GALAND 1980: 352). Thus in Zenaga, the statives meaning ‘be beautiful’ (*iymundur*) and ‘be thin’ (*äyṃuḍ*) are essentially used in the Perfective with timeless continuous meaning: *yäyṃandur* ‘he is beautiful’ and *yiyṃaḍ* ‘he is thin’. On the contrary, the statives/inchoatives meaning ‘be/become famished’ (*umṃuḡziy*) and ‘be/become stable’ (*ärgəg*) can be used in both forms, and inchoative meaning is only conveyed in the Imperfective (with present or future meaning): *yərgəg* ‘he is stable/has become stable’, *yittərgug* ‘he is becoming/will become stable’.

The “quality” verbs under consideration here, like most verbal lexemes, have a single affixal system for all conjugation paradigms (except in the imperative).³ person markers are suffixed (1SG, 3PL), prefixed (3SG.M, 3SG.F, 1PL) or both (2SG, 2PL). In the preceding examples, initial *y-* marks the 3SG.M (*y-ərgəg*).

“Quality” verbs, like all verbs, are mainly used in predicate function. Any verb form bearing a person marker constitutes a full sentence. The marker agrees in gender and number with the lexeme it represents, whether present or not in the clause.⁴ Thus in Zenaga:

(2)	<i>äyṃoṣṣi</i>	a)	<i>y-iyāh</i>	b)	<i>wār</i>	<i>y-iyīh</i>
	knife		3SG.M-be.sharp.PFV		NEG	3SG.M-be.sharp.NEG.PFV
		a)	‘the knife is sharp’.	b)		‘the knife is not sharp’.
(3)	<i>äyṃoṣṣi</i>	a)	<i>y-uḍar</i>	b)	<i>wār</i>	<i>y-uḍur</i>
	knife		3SG.M-fall.PFV.		NEG	3SG.M-fall.NEG.PFV
		a)	‘the knife fell’.	b)		‘the knife didn’t fall’.

Whether the verb be a “quality” verb (*yiyāh*) or an action verb (*yūḍar*), there is no formal difference between examples (2) and (3). The same is true of secondary predicates, for example in relative clauses where the person marker on the verb refers to the antecedent (and in which case the relative clause cannot contain an explicit lexical subject). These relatives (see GALAND, same volume, section 3.5) are recognizable in that they bear a “participial” verbal suffix, generally containing a nasal consonant.⁵ Thus in Zenaga (SG *-än*, PL *-in*):

(4)	<i>uẓẓar-ag</i>	<i>t-aṛbaḍ</i>	a)	<i>t-uḍur-än</i>	b)	<i>t-äyṃāndur-än</i>
	see.PFV-1SG	F-girl.SG		3SG.F-run.PFV-PTCP		3SG.F-be.beautiful.PFV-PTC
	‘I saw a/the girl		a)	(who) fell’	b)	(who) is beautiful’

The so-called participial form of the verb is identical for all verbs in a given language, however some eastern varieties such as Nafusi and Siwi do not have a

³ Only a few eastern varieties such as Ghadamsi show specificities in the singular Future (KOSSMANN 2000a).

⁴ If postposed on the verb, the “subject” lexeme is in the annexation state (AS), except in the case of Berber varieties such as Zenaga which do not distinguish between state types.

⁵ One also finds dental consonants, e.g. *-t* in the 3SG.F, in Tuareg. Alongside GALAND (2006: 60), I believe this *-t* to be secondary, and that *-n* was formerly the only suffix.

“participial” suffix (LAOUST 1931: 55).⁶ Moreover, in some varieties, the “participial” relatives are used only if the antecedent is definite; such is the case in eastern Riffian (KOSSMANN 2000b: 156).

1.2. Specific patterns

Beyond the case of the Imperfective, which usually requires the prefixation of *t*- or gemination of one root consonant, the various verbal aspect-tense or aspect-mood paradigms (TAM) — Aorist vs. Perfective, affirmative Perfective vs. negative, etc. — are mostly distinguished by changes in the vowel pattern. Moreover, these patterns vary from dialect to dialect, depending on each variety's verbal sub-classes. While the pattern in the (affirmative) Perfective is often of the type (*i/u/ə*)–*a*, one notes that it is often of the type (*ä*)–*i/u/ə* for “quality” verbs. In southern varieties, vowel alternations are particularly striking.

For Tahaggart, PRASSE (1973-74: VII, 145) establishes that “[*s*]émantiquement, les verbes de la cj. II étaient des verbes inintentionnels (signifiant surtout des fonctions sensorielles et mentales) et des verbes de qualité passagère” (“[*s*]emantically, verbs in cj. II were unintentional verbs (referring mostly to sensory and mental functions) and verbs denoting passing qualities”), and that there is a (± intentional) semantic opposition between:

(5)	Cj. I	‘choose’	AOR	<i>ifrən</i>	PFV	<i>ifrən</i>	NEG.PFV	<i>ifrin</i>
	Cj. II	‘be distinguished’	AOR	<i>yufən</i>	PFV	<i>yäfrun</i>	NEG.PFV	<i>yäfrun</i>

One finds a comparable distinction in Zenaga. The patterns are exactly inverted in Perfectives: “non-*a*”–“*a*” vs. “*a*”–“non-*a*” (COHEN & TAINE-CHEIKH 2000):

(6)	Cj. I	‘fall’	AOR	<i>yaḍur</i>	PFV	<i>yuḍar</i>	NEG.PFV	<i>yuḍur</i>
	Cj. II	‘dry out’	AOR	<i>yuʔmum</i>	PFV	<i>yäʔmum</i>	NEG.PFV	<i>yuʔmum</i>

In this language, verbs in cj. II are mostly inchoatives. Some of the latter form pairs with related stative verbs having the constant vowel pattern “non-*a*”–“*a*”. Whence the following distinction in the NEG.PFV (TAINE-CHEIKH 2009):

(7)	a) ‘dry out’:	NEG.PFV	<i>wär^yuʔmum</i>	‘it has not dried out’
	b) ‘be dry’:	NEG.PFV	<i>wär^yaʔmum</i>	‘it is not dry’

The situation in Siwa, with very rare “quality” verbs of Berber origin (LAOUST *op. cit.*: 62-65) is inverse to that of the southern varieties⁷.

1.3. “Quality” verbs with specific conjugations

In several Berber varieties, stative verbs expressing adjectival type properties have an irregular Perfective paradigm, with its own specific pattern and conjugation. In Tahaggart, verbs in this sub-class (cj. IV in PRASSE 1973-74: VII, 182) in this case refer to permanent qualities rather than transient ones:

⁶ Also note in Nafusi (BEGUINOT 1933: 119): *aterräs yéza’am* ‘a good person’.

⁷ Here I leave aside the question of the suffix *-a* the use and the value of which are currently a matter of discussion.

2. Nominal extreme

2.1. Purely semantic specificities

In Berber there are numerous nominal forms which express physical or moral qualities, but which show no morphological or syntactic characteristics to set them apart from other nominals. In Zenaga, such is the case of *ägmär* which means ‘tall’ (as well as ‘young adolescent’) and of numerous nominal forms with a nasal prefix. The fact that habitual meaning is inherent in these forms in *n-/m-* has given rise to “adjectival” morphemes which correspond to more or less transient properties (*änähtəf* ‘mistrustful’, *amugniš* ‘having a fighting spirit’, *änäffuḍ* ‘(constantly) thirsty’...) and “substantival” lexemes referring, among others, to professions and objects (*ämäžär* ‘emir’, *änmuʔḍ* ‘blacksmith’, *ämšəgḍi* ‘glass’...). They all show similar agreement in gender and number, taking the same affixes: SG.M *a—*, SG.F *ta—t*, PL.M *ə—än*, PL.F *tə—ən*.

Like their Tuareg equivalents,¹¹ *ägmär* and Zenaga forms with a nasal prefix show the same syntactic behavior as nouns.

To serve as predicates, like other nouns (13a, 14a), they require the presence of an auxiliary: either the deictic *äḍ* (13), or the verb *ägi* ‘become’ which, in combination with the negation marker *wär*, gives rise to the contracted form *wä=ygi* (14).

(13a)	<i>nəttä</i>	<i>äḍ</i>	<i>aḡmä=n=š</i>	‘it is his brother’
(13b)	<i>nəttä</i>	<i>äḍ</i>	<i>änähtəf</i>	‘he is mistrustful’
(14a)	<i>nəttä</i>	<i>wä=ygi</i>	<i>aḡmä=n=š</i>	‘this is not his brother’
(14b)	<i>nəttä</i>	<i>wä=ygi</i>	<i>änähtəf</i>	‘he is not mistrustful’

To modify a noun, a genitive construction is used containing the preposition *ən* ($N_1 \text{ } \textit{ən} \text{ } N_2$). The only particularity to be noted in (15b), as compared to ordinary noun modifiers (15a), is that N_2 agrees in gender and number with N_1 . However this is similar to superlative constructions (16) where there is agreement in gender — and in number with *ägmär* in (16a) — between N_1 and N_2 .

(15a)	<i>t-nišʔəm-t</i>	<i>ən</i>	<i>ämäžär</i>	‘(the) emir's wife’
(15b)	<i>t-nišʔəm-t</i>	<i>ən</i>	<i>t-änähtəf-t</i>	‘(a/the) mistrustful woman’
(16a)	<i>t-ägmär-t</i>	<i>ən</i>	<i>t-məkšən-t</i>	‘the greatest enemy’
(16b)	<i>waʔr</i>	<i>ən^ iʔrän</i>	(lit. ‘lion among lions’)	‘the strongest of lions’ ¹²

The structure $N_1 \text{ } n \text{ } N_2$ is highly productive in Berber. GALAND ([1969] 2002: 204-5) notes a variety of examples in several languages. The following is taken from Foucauld (1951-52: I, 33). It is comparable to (15) but has a proper noun as N_1 :

¹¹ In Tahaggart, forms in *n-/m-* refer to humans or animals having a specific quality: *amyar* ‘tall man’, *änäywal* ‘duck-footed man or animal’. These are true nouns, even though PRASSE (1973-74: IV, 97) calls them “verbal adjectives”.

¹² There is no difference between relative and absolute superlatives. Thus (16a) could be translated as ‘a very great enemy’ and (16b) as ‘a very strong lion’.

- (17) *mimi n tāmānhuk* ‘Mimi of the mad woman, Mimi's mad woman’

2.2. Some morphological specificities

Chaker (1995: 25-28) lists the various adjective patterns found in the northern Berber dialects and concludes: “*adjectives are often recognizable by their form*”. *aCCac*, *aCvCaC* and *aCCCVc* are patterns found in both nouns and adjectives. But *uCCiC*, *aM/N---u*, *iMiCCiC* and above all *(a)CCan*, *(a)CC:Can*, *(a)CvCan* are only found in adjectives. Chaker suggests considering the suffix *-an* (present in *aberkān* ‘black’, *aquran* ‘dry’, *azayan* ‘heavy’ ...) as an adjective suffix.¹³

In Kabyle, the patterns *uCCiC* and *iMiCCiC* often convey “*imperfection of the quality*”, whence the following distinctions: *amllal* ‘white’ vs. *umlil* ‘whitish’; *aberkān* ‘black’ vs. *imibrik* ‘blackish’. The same semantic shades are expressed elsewhere through different means. In Figuig, by using the prefix *ca*: *camlal* ‘whitish’ (KOSSMANN 1997: 120). In Tamazight, by the affix *hr-* (GALAND 2010b: 54): *aḥrmLal* ‘whitish’.

Such (alongside the relational suffix *-i/y* and constructions with *bu* ‘that of’ or *war* ‘without’) are the main indicators whereby an adjective (or an “adjectival” noun) can be recognized by its form.

2.3. Some syntactic specificities

The predicative uses of “adjectival” nouns have few specificities as compared to other nouns. Generally speaking, predicative auxiliaries are used, and adjectival predicate negation is the same as for nominal predicates.

In Shilha (18), it is the verb *g* ‘do’. In many northern varieties, namely in Kabyle (19), predication is mediated by *d* — a deictic which is present even when the clause is negated.

(18)	a)	<i>iga</i>	<i>argaz</i>	‘it is (a) man’	b)	<i>iga</i>	<i>umlil</i>	‘he/it is white’
(19)	a)	<i>d</i>	<i>argaz</i>	‘it is (a) man’	b)	<i>d</i>	<i>amllal</i>	‘he/it is white’

In Nafusi (BEGUINOT 1931: 118), there is no predication auxiliary (as for nouns). However, the subject is often modified by a demonstrative (here *ūh*):

- (20) *bušīl ūh ameškān* ‘this guy is small’

The same is true in Siwi (LAOUST *ibid.*), except that the negation marker used (*la*) is that of verbal predicates (noun predicates take *qačči*). This is one of the rare elements which distinguish between adjective and noun predicates.

The differences are much greater however in the attributive uses of “adjectival” nouns. In parallel to the rather limited use of the genitive construction (*N₁ n N₂*), one very often finds direct constructions, without *n*.

‘Adjectival’ determination is distinct from genitive constructions without *n* on several points. On one hand (for all varieties which distinguish between states), one

¹³ He further notes that adjectives in *-an* are almost always formed on a stative verb.

finds N_2 in a free (or absolute) state.¹⁴ Whence the distinction highlighted by CHAKER (*op. cit.*: 24) between the attributive adjective in (21a) and the substantivized adjective serving as noun modifier, in (21b):

- (21a) *afus aberkan* (FS) ‘the/a black hand’
 (21b) *afus uberkan* (AS) ‘the hand of the black’

On the other hand, one notes agreement in gender and number between N_1 and N_2 .

Although agreement in gender and number has become generalized in the varieties using this construction, at times one finds differences between masculine and feminine — but it might be misinterpretation.¹⁵

Other varieties also show some alternation (presence vs. absence of *d*), but it depends on whether N_1 is modified or not. In Ouargla, according to BIARNAY (1908: 186), a direct construction is used when N_1 is determined (*aidi ou amellal* ‘my white dog’), but *d* precedes the adjectival noun if N_1 is entirely undetermined:

- (23) *iioui d adyay d aziouar*
 bring.PFV.3SG.M PROX rock.SG.M COP big.SG.M
 ‘he brought a big rock’ (lit. ‘he brought (a) rock (it) is big’)

In Djerba, *d* (with a specific accentuation) has also come to mark indefiniteness according to VYICHL (2005: 140-1):¹⁶

- (24) a) without COP: *áfrux ámeqran* ‘the big boy’
 b) with COP: *afrox d ámeškan* ‘a little boy’

In Awdjilah (PARADISI 1960: 158), definiteness is also expressed by direct constructions. Here however speakers have the choice between an “adjectival” noun (*mlil* ‘white’, *ameskún* ‘small’, *amoqqarân* ‘tall’) and an “adjectival” verb: *mellél* ‘(be) white’, *meššék* ‘(be) small’, *móqqar* ‘(be) tall’.¹⁷ The same situation obtains in Nafusi (BEGUINOT *op. cit.*: 118):

- (25) a) “adjectival” noun: *bušil ameškân* ‘the little boy’
 b) “verbal” adjective: *bušil meššék* ‘a little boy’.

¹⁴ On the free/annexed state opposition, see METTOUCHI, this volume.

¹⁵ Thus in the Tunisian Sened dialect, the copula *d* appears after *ergäz* (masculine noun) but not after the feminine noun *tameṭṭut* (PROVOTELLE 1911: 92):

(22) *ergäz d amoqqrar aḡ=es t-ameṭṭu-t t-ausser-t äm netta*
 man.SG.M COP old.SG.M at=PR.3SG.M F.woman.SG F.old.SG like he
 ‘An old man had a wife who was as old as he’

The distinction (*d* vs. $\emptyset$) reappears in predicative function (*ibid.*: 44).

¹⁶ The same is true in eastern Riffian (KOSSMANN 2000: 155). In Siwi on the other hand it is an *n* which at times appears before the adjectival noun. VYICHL (*op. cit.*: 213) interprets this *n* as an indefinite marker whereas SOUAG (2010: 151-2) instead considers it a generic marker.

¹⁷ The adjectives *vürek* ‘largo’ and *feššūš* ‘leggero’ are nonetheless used with both definite and indefinite meaning (PARADISI *op. cit.*: 168).

3. The noun-verb continuum

3.1. Adjectives which can (more or less) inflect

In section 1.3. we saw that the “quality” verbs examined only showed specific behavior in the Perfective, where inflection is suffixed and the meaning is purely static. This is particularly true of “qualitative” verbs in Kabyle, in Ghadamsi and, to a lesser extent (due to the presence of certain prefixes) in Tuareg.

In other varieties however “quality” verbs are stative verbs showing defective inflection (they only inflect in the Perfective). Such is the case in Awdjilah where the verb *meššék* has only five distinct forms (PARADISI *op. cit.*: 171):

- (26) *meškāh* ‘I am small’; *meškāt* ‘you are small’; *meššék* ‘he is small’; *meškét* ‘she is small’; *meššīkīt* ‘we/you/they are small’¹⁸

It is also the case in Nafusi and Zenaga, except that in the latter variety there is a distinction between the Perfective form of “quality” processive verbs and stative verbs, which have suffixal inflections — which is why for Zenaga I choose to speak of “inflected adjectives” (TAINE-CHEIKH 2003). Thus in Zenaga:

(27)	<i>kāʾrišš-äg</i>	‘I am active’	vs.	<i>kuʾrāšš-äg</i>	‘I became active’
	<i>ẓäwzəg-äd</i>	‘you are deaf’	vs.	<i>t-azẓūzag-äd</i>	‘you became deaf’
	<i>bäyḍig</i>	‘(he/it is) green’	vs.	<i>y-äbbīdag</i>	‘he/it became green’
	<i>ädäy-äd</i>	‘(she is) brown’	vs.	<i>t-ädīy</i>	‘she became brown’

In Zenaga adjectives constitute quite an important category. They generally have the pattern *CaCCi/u/əC* (or a variant thereof such as *CaCī/ūC*: *käyīy* ‘short’)¹⁹ and differ from both verbs and nouns.

Morphologically speaking, they behave inflect like verbs — but they inflect only through suffixation and mostly in the 1SG and 2SG. In impersonal forms (3SG and 3PL), they differ from nouns i) in the absence of both the initial vowel and the prefix, and ii) in their specific paradigm of suffixed markers. Compare, in Zenaga:

(29) a) “verbal” ADJ: ‘(be) green’	SG.M	<i>bäyḍig</i>	SG.F	<i>bäyḍig-äd</i>
	PL.M	<i>bäyḍig-äd</i>	PL.F	<i>bäyḍig-äd</i>
b) ADJ noun: ‘mistrustful’	SG.M	<i>änähtəf</i>	SG.F	<i>t-änähtəf-t</i>
	PL.M	<i>ənähtəf-än</i>	PL.F	<i>t-ənähtəf-ən</i> ²⁰

Syntactically speaking, they essentially behave like verbs in predicative function:

¹⁸ The situation in Nafusi is similar, but the adjective does not take a person marker in the 1SG and 2SG.

¹⁹ The pattern *CvCCvC* is widespread in the other varieties. This means that in Ghadamsi it corresponds to the pattern often found in the Perfective of “quality” verbs (LANFRY 1968: 286):

(28) *mədri* ‘(be) small’; *semməd* ‘(be) cold’; *seṭtef* ‘(be) black’; *zaggay* ‘(be) red’; etc.

²⁰ In some western Riffian varieties, the “verbal” adjective and the adjectival noun coexist and are both used — with or without *ḍ* — after *aḡul* ‘become’ (LAFKIOUI 2007: 165):

(30) a) “verbal” ADJ: *aḡul-eḡ* *meqqur* (M) / *meqqur-eṭ* (F) ‘I (M/F) became big’

b) ADJ noun: *aḡul-eḡ ḍ ameqran* (M) / *t-ameqran-t* (F) ‘I (M/F) became big’.

Moreover, there exists also the stative verb’s Perfective (which is normally conjugated): *i-meqqur* ‘he/it is big’.

without the copula *äḍ* and sharing the same verbal negation marker *wär* (cf. (2)-(3)). Compare the behavior of the adjective in (31) to that of the nouns ((13)-(14)):

(31)	Zenaga	a)	<i>nəttä</i>		<i>ṁänəg</i>	‘it is comfortable’
		b)	<i>nəttä</i>	<i>wär</i>	<i>ṁänəg</i>	‘it is not comfortable’

When used as a modifier (attributive), it is in the "participial" form (like the verb in (4), with no prefix however in the SG). Compare the behavior of the Zenaga adjective in (32b) to that of the adjectival noun in (15b):

(32)	Zenaga	a)	SG.M	<i>äräbih</i>	<i>mäzzūg-än</i>	‘(a/the) little boy’
		b)	SG.F	<i>tarbaḍ</i>	<i>mäzzūg-än</i>	‘(a/the) little girl’
		c)	PL.M	<i>äräbān</i>	<i>mäzzūg-ən</i>	‘(the) little boys’
		d)	PL.F	<i>träbīn</i>	<i>mäzzūg-ən</i>	‘(the) little girls’.

In Nafusi on the contrary, because the form bears no “participial” suffix this means that, like for the verb (cf. note 6), there is very little to distinguish between the adjective’s two functions:

(33)	Nafusi	a)	<i>nīt</i>	<i>mellél</i>	‘it/he is white’	(<i>egli è bianco</i>)
		b)	<i>aterrás</i>	<i>mellél</i>	‘a white man’	(<i>un uomo bianco</i>) ²¹

3.2. Adjectival comparatives and superlatives

Comparisons are generally expressed through modifiers, with the predicative core (whether verbal or nominal) remaining unchanged. There are nonetheless two specific constructions which we will examine here.

Several Berber languages use comparative forms borrowed from Arabic. These were originally adjectives having the pattern *aCCaC* in the M.SG, which became invariable in the Arabic dialects. In Berber, these forms appear to be used without predication auxiliaries, even in those dialects which normally require one (cf. PROVOTELLE *op. cit.*: 44-5). Furthermore, Siwi revisited the Arabic comparative system by attributing a different pattern to it (*CCəC*) and extending it to Berber lexemes (SOUAG 2010: 158):

(34)	Siwi	a)	<i>aqdim</i>	‘old’	>	<i>qdəm</i>	‘older’	(< Arabic)
		b)	<i>agzal</i>	‘short’	>	<i>gzəl</i>	‘shorter’	(< Berber)

The second specific construction concerns two superlative forms meaning ‘(very) bad, (the) worst’ and ‘(very) good, (the) best’. Thus in Zenaga:

(35a)	M.SG	<i>ägmä^ mīn</i>	‘best individual’
	M.PL	<i>əgmä^ mān</i>	‘best individuals’
(35b)	F.SG	<i>t-ägär tnäwdəḍ</i>	‘worst year’
	F.PL	<i>t-gär tnūdän</i>	‘worst years’.

One finds traces of the second in several Berber languages where they are (almost) always distinguished from nouns and verbs — both morphologically and

²¹ The same is true for nouns, because there is no copula (BEGUINOT *op. cit.*: 118).

syntactically (GALAND 2010a: 153; TAINE-CHEIKH 2012: 273-7). The evaluative is in head position and is not followed by *n* (contrary to nouns). When it is not invariable, it agrees in gender and number with the noun it modifies (however variation is irregular and only affects the initial segment).²²

Conclusion

DIXON was right to highlight the substantial crosslinguistic variations in the syntactic categories called upon to express adjectives. Berber languages however do not all belong to a single type, and one notes a tendency across all of the languages (with exceptions such as Tuareg and Ghadamsi) to make use of several different syntactic devices (see Table 1). Generally speaking, some “adjectives” behave like verbs and others like nouns — either completely, or partially (which explains the existence of specific sub-classes). One also finds classes made up solely of adjectives.²³ This is particularly clear in Zenaga and Awdjilah (spoken geographically far from each other), noting however that the data in these two varieties show major similarities with some “quality” verbs (having a specific Perfective paradigm) found in other varieties.

Table 1: ZEN ‘Zenaga’, SHL ‘Shilha’, KAB ‘Kabyle’, TRG ‘Tuareg’, GHD ‘Ghadamsi’, AWJ ‘Awdjili’, NAF ‘Nafusi’, SIW ‘Siwi’

			ZEN	SHL	KAB	TRG	GHD	AWJ	NAF	SIW
VERB	A	ADJ verb spec. pattern	+	+	+	+	+	+	+	(+)
	B	PFV without prefixes PTCP without prefixe(s)	+	(+)	(+)	+	+	–	–	
NOUN		ADJ noun	+	+	+	–	–	+	+	+
		spec. syntax	–	+	+			+	+	NEG
		attributive / predicate	≠	≠	≠			≠	=	=
[ADJ]		spec. pattern	+		+	+	+	+	+	
		cj. without prefixes	+		+	(+)	+	+	+	
		spec. 3F.SG & PL suff.	+		+	(+)	+	+	+	
		comparative/superlative	+	(+)	(+)	+				+

The “intermediate states” are attested in the ancient Berber language. I believe that the adjective category (recognizable by its pattern and its specific gender and number markers) must have existed in Proto-Berber.²⁴ There would have been very few adjectives, and they would have expressed properties such as size, color and perhaps certain physical defects (similar to the *afʿal* pattern in Arabic) Their

²² In those varieties which distinguish between states, N₂ remains in the FS (contrary to genitive constructions).

²³ In total, out of the five types described by DIXON, type (3) does not appear to be the best represented (only a few eastern varieties have a single form for both attributes and predicates)... unless perhaps one were to consider that the “participial” suffix *-n-* is the exact equivalent of the genitive preposition *n* — a hypothesis which is interesting, but needs to be better documented.

²⁴ CHAKER suggests (*op. cit.*: 30) that Tuareg, a language without adjectives, lost many of the former adjectival class's distinctive features. I believe this to be true of other varieties as well.

combination in the singular with suffixed person markers in a large number of Berber languages is sufficient to consider that it is an ancient mechanism. The integration of the Perfective of some “quality” verbs (whether stative or not) is probably a secondary development (GALAND 1980) as Zenaga and Awdjili appear to illustrate. The tendency to regularize “intermediate” cases (of which there are others, e.g. numerals and quantifiers, which are not mentioned here) seems to have also affected evaluatives (comparatives and superlatives). One finds traces of an earlier system in some varieties, just as in Kabyle one may consider that the *-n* ending found on “adjectival” nouns is probably the relic of the “participial” suffix *-n*.

As far as GIVÓN's *Time Stability Hypothesis* is concerned, one can only note that there is very little semantic specialization of nouns, verbs and adjectives (especially in languages without a specific adjectival class). One does however see specialization within a single class, especially in verbs (cf. Tuareg and its distinction between permanent and transient qualities, or Zenaga and its distinction between stative and processive verbs). Lastly, in some varieties (particularly eastern ones) one observes an interesting specialization whereby “adjectival” nouns are used in the definite and “verbal” adjectives are used in the indefinite.
