A Positive Case for the Visuality of Text in Warring States Manuscript Culture

Daniel Morgan, University of Chicago

Paper for
“The Creel-Luce Paleography Forum”
University of Chicago, 24-25 April 2010

In the beginning was the Word, and the Word was with God, and the Word was God… And the Word was made flesh, and dwelt among us, (and we beheld his glory, the glory as of the only begotten of the Father,) full of grace and truth.

John 1.1-14

When in early antiquity Pao Hsi ruled the world, he looked upward and contemplated the images in the heavens; he looked downward and contemplated the patterns on earth. He contemplated the markings of birds and beasts and the adaptations to the regions. He proceeded directly from himself and indirectly from objects. Thus he invented the eight trigrams in order to enter into connection with the virtues of the light of the gods and to regulate the conditions of all beings.

Xici zhuan 繫辭傳, tr. Wilhelm/Baynes

The first impression one gets when working with Chu manuscripts is that their language is equivocal and erratic, as if randomization was the rule in writing graphs and transmitting texts. In the absence of clear contemporary evidence, attempts to explain the variation must rely primarily on conjecture and analogy, the result of which is impassioned and irresolvable debate. The inspiration for this paper came from just such a debate at the International Symposium of Excavated Manuscripts and the Interpretation of the Book of Odes (Chicago, 9/13/2009) between several scholars subscribing to very distinct approaches. When the issue of textual transmission was raised, Martin Kern reiterated the conclusions of his previous research: in Shijing quotations in early manuscripts the large majority of

1 I would like to thank Professors Donald Harper and Edward Shaughnessy for their invaluable feedback on this project, as well as their invitation to present it at the “Creel-Luce Paleography Forum.”
variants are phonetic, and this is best explained by the role of orality and memory, i.e. the transmission of texts as sound independent of writing. In response, Edward Shaughnessy and William Baxter each offered their own explanations for these phonetic variants: respectively, that scribes may have simply had a habit of phonetic loaning, and that regional languages and scripts might be responsible. A consensus was not met.

At the time, my own work with the two copies of the Shanghai Museum Tianzi jian zhou 天子建州 (TZJZ) in 2007 had led me to the conclusion that texts were copied visually. However, this conversation reminded me that my own conclusions rested on a number of untested assumptions and a sample that was at once too small and too incomparable with Kern’s Shijing quotations to claim broader representativeness.

In 2007, when TZJZ was essentially the only Warring States text to have been recovered in two editions from the same tomb, I submitted its duplicates to rigorous comparison, figuring that their relative proximity in time and space would make them better controls in assessing the features of textual transmission. Their proximity promised to eliminate the unknowable vagaries lurking between the hundreds of years and kilometers separating editions of other, more studied texts.

Reading the two editions side-by-side, I compiled a list of every single divergence, down even to the difference of a single decorative stroke, lest I be criticized for not being thorough. These “textual variants” I then divided among five categories:

- **Stylistic:** variants at the level of base components or 文, i.e. the omission, abbreviation or decorative addition of strokes (文 vs. 文 for 可), the different execution of same component (文 vs. 文,形 vs. 形, and 家 for 家) and the rearrangement of components in composite graphs (家, 家). Except for superficial visual differences, such variants do not reflect any difference in the triumvirate of form 形, sound 音 or meaning 義; they are, for all intents and purposes, exactly the same.

- **Graphic:** variants at the level of composite graphs or 字 in the typical addition, omission or exchange of semantic classifiers in phonograms 形聲字 or semantographs 表義字.

---

3 In this paper I make use of the following Warring States manuscripts, which I have abbreviated for convenience: **BS** for Hubeisheng Jing-Sha tielu kaogudui 湖北省荆沙鐵路考古隊, ed., Baoshan Chu jian 包山楚簡 (Beijing: Wenwu, 1991); **GD.ZYa-c** for Laozi 老子 A-C, **XZMC** for Xing zi ming chu 性自命出 and **GD.ZY** for Zi yi 緇衣 in Jingmen shi bowuguan 荊門市博物館, ed., Guodian Chu mu zhiqian 郭店楚墓竹簡 (Beijing: Wenwu, 1998); **SB.ZY** for Zi yi 緇衣, **SB.Zhouyi** for Zhou yi 周易, **SB.RCS** for Rongcheng shi 容成氏, **TZJZa-b** for Tianzi jian zhou 天子建州 A-B, **ZZJSa-b** for Zheng z i Jia sang 紛子家象 A-B, **JZa-b** for Junren zhe he bi an zai 君人者何安哉 A-B, **FWLXa-b** for Fan wu liu xing 凡物流型 A-B in Ma Chengyuan 马承源, ed., Shanghai bowuguan cang Zhanguo Chu zhusu 上海博物館藏戰國楚竹書 (Shanghai: Shanghai guji, 2001-). **ZJT** for Hubei Sheng Jingzhou Shi Zhoulouyang yuqiao yizhi bowuguan 湖北省荊州市周梁玉橋遺址博物館, ed., Guanzhu Qin Han mu jian du 開沮秦漢墓簡牍 (Beijing: Zhonghua shuju, 2001).

4 The Guodian and Mawangdui Wu xing 五行, for example, were written in different scripts and interred some two centuries and 250km apart. It seems to me that a lot could have happened in between.

Daniel Morgan “A Positive Case for the Visuality of Text in Warring States Manuscript Culture” (24 April, 2010)
expressing the same word, e.g. 青 vs. 情 for “inner state” or 樂 vs. 悅 for 樂 “music.” In this category I also include allographs — distinct graphs used to express the same word, i.e. sound and meaning—such as 誉 and 喜 for dao 道 “Way”.

- **Phonetic:** the loan of a semantically unrelated graph to stand in for the phonophoric of a graph or the graph itself to express the same word, e.g.: 童 (*doŋ) for 童 (*drjoŋ) in 動/動 “to move” (*doŋ/) or 異 (*jew) for 諲 (*jew) “ditty”.
- **Lexical:** variants expressing graphically, sonically and semantically distinct words, e.g. “night” and “day”.
- **Omissions/additions:** where one edition has text the other does not, e.g. “you look good” and “you look good for someone your age”.

Naturally, such categories are somewhat arbitrary and imperfect, but they adequately serve my purpose: to illustrate clearly how and how much Chu editions of the same text differ. I have listed all textual variants in the Appendix and invite the reader to audit my findings.

When compared, manuscripts A and B are starkly identical. Of 344 overlapping graphs, only 9 (2.6%) vary at the structural or phonetic level, and even then only prosaically so. Even starker is the coincidence of orthographies peculiar to TZJZ that are reproduced exactly in both MSs, e.g. A4 and B3 for 孪 “calamity,” A6 and B5 for 楚 (“Centroseptentriones.”) Second, there are peculiarities that occur alongside common orthographies, the pattern of which is identical in both MSs, e.g. the particle 也 appears first as A3 and B2, and subsequently in the common form A3/B2: 凡 occurs both as A1/B1 and the peculiar A8/B7 in exactly the same places in the text; likewise for 義, which is written peculiarly as A6/B6 and A8/B7. Furthermore, in both MSs 語 “to speak of” is used at the head of eight formulaic admonitions, the first two of which give the full form and the last six of which are abbreviated to 言. Third, even non-linguistic information coincides with startling fidelity, e.g. the decoration of basic graphs like 不 (A2/B2) is identical, as is the pattern of alternation, such that 仏 (度) is written in the first instance with a decorative horizontal line (A7/B7), then without (A8/B7). Even the size, shape and distribution of punctuation and reader’s marks is identical. One cannot be certain of the exact circumstances, but it appears that the one was

---

5 All phonological reconstructions are those of William Baxter’s Old Chinese from A Handbook of Old Chinese Phonology (Berlin: Mouton de Gruyter, 1992).

6 The graph 言 is found nowhere else outside of TZJZ. The logic behind simplifying the phonophoric 五 (*nra?) to its phonophoric 仏 ("nra") , however, is quite obvious.

7 Both manuscripts feature an assortment of markings typical of the Shanghai corpus and Chu manuscripts in general. First in apparent importance are L- or hook-shaped punctuation marks that appear twice, once at the very end and once near the middle of the text, appearing to mark the end of textual sections. This usage is common within the Shanghai corpus and seems to coincide with a change of topic in the text itself. Both manuscripts are consistent in their use of this mark. Second are the short, bold lines appearing at the right edge of the strip after the last in a line of repetitive statements as caesura, as well as between densely packed graphs apparently to facilitate disambiguation. This later usage can be seen in strip 8 of Manuscript B where two such marks fall between three densely packed graphs. Because this usage is determined by unique conditions of legibility and spacing one does not expect nor see consistent use between manuscripts. Both MSs are consistent except in cases of disambiguation peculiar to each. Of course both manuscripts also feature ligature marks 合文號.
copied from the other or from some hypothetical antecedent or line of antecedents. What is certain, is that there can be no other explanation for these coincidences than the two MSs are connected through unbroken visual copying.  

To argue the representativeness of such a small sample would be foolhardy. Conveniently, the latest volume (VII) of the Shanghai Museum corpus has furnished an additional three duplicate MSs to submit to such analysis: Zheng zì Jia sang 郑子家丧 (ZZJS), Junren zhe he bi an zai 君人者何必安哉 (JRZ) and Fan wu liu xing 凡物流型 (FWLX). Like the TZJZ, the differences between these MSs are minimal.

Aside from their mechanical similarity, each manuscript provides other, unequivocal evidence of visual copying between editions. Throughout both MSs ZZJSa and ZZJSb consistently render the particle 而 as A1 and B1, however, ZZJSa slips once into the orthography of ZZJSb—A4. Both MSs also read 炎 “inflammation” (A2 / B2) where context suggests the graphically similar 光 “glory” (usually written like BS261)—an obvious clerical error. The two editions of JRZ feature orthographies seen nowhere else in pre-Qin writing, such as A2 and B2 for (c.f. BS202), A3 and B3 for 貞 (c.f. GD.Za13 and SB.Zhouyi15), A4 and B4 for 十 (c.f. BS137和SB.RCS14). The case for copying in FWLX is the most evident. In the first instance of the graph 骨, both MSs produce the same common orthography—A5 / B4—yet one slip later

---

10 These examples are from Li Songru 李松儒, “Zheng zì Jia sang jia yi ben ziji yanjiu” 《郑子家丧》甲乙本字迹研究, BSM <http://www.bsm.org.cn/show_article.php?id=1062>, posted Jun. 2, 2009. Li argues that ZZJSa is a fair copy of ZZJSb.

Daniel Morgan “A Positive Case for the Visuality of Text in Warring States Manuscript Culture” (24 April, 2010)
both feature an irregularly thick inkblot of a line in the exact same place—A6/B5. Furthermore, not only is the distribution of reader’s marks identical, they undergo the same general evolution in shape from line to hook over the course of both manuscripts.11

Of course, none of this disproves the influences of orality, scribal creativity or regional languages on Warring States textual transmission. Rather, it merely proves what most had assumed in the first place: that exact copying was indeed one mode of textual transmission practiced at the time.

Now I would like to return to Martin Kern’s argument for orality in his “Methodological Reflections on the Analysis of Textual Variants and the Modes of Manuscript Production in Early China” (2002) and “The Odes in Excavated Manuscripts” (2005). The goal of Kern’s 2002 article, as I understand it, is to problematize William Boltz’ application of the neat stemma codicum model of text criticism to what is a rather linguistically erratic corpus of manuscripts. For his sample, Kern (2005) compares the Mao recension of the Shijing against quotations found in ① the Ziyi 緇衣 of the Guodian and Shanghai Museum corpora and the received Liji 禮記, ② the Shanghai Museum Kongzi Shi lun 孔子詩論, and ③ the Guodian and Mawangdui Wu xing 五行. From this Kern (2002: 161-2) produces some weighty statistics: textual variants occur in about one of every three graphs, and only 24 out of 171 (i.e. 14%) “show no immediately apparent phonological connection.” He concludes that the necessary explanation for these statistics is the transmission of the text of the Shijing through memory and oration—as sounds outside of the written word. This does not need to be the sole, or even the primary mode of transmission, but it must have happened occasionally, and so long as it did, it would randomize the linguistic information of a text, thwarting a stemma codicum model predicated upon the assumption of faithful copying:

Comparing two manuscripts, or a manuscript and a received text, the evidence from textual variants therefore poses the following two alternatives to decide upon: either there is a direct act or an uninterrupted sequence of copying from the first to the second manuscript, or the transmission processes included at least one interruption of such a sequence (or was perhaps entirely based on memory or oral transmission).12

Here two points require attention in the context of the present discussion. First, his comparisons of excavated and received quotes are against the Mao recension, not against each other. This helps quantify the sort of changes the Odes underwent in the Han to become the text it is today, as is the purport of Kern (2005), but cannot tell us much about the features of its transmission in the Warring States. Second, his emphasis that 86% of variants are phonologically related is to draw a distinction with lexical variants and scribal errors—the sort of variants more typical of stemma codicum analysis. In actuality, this 86% is predominately composed of what I have classified as “graphic variants” (e.g. 共、鷄=恭) with only a very small percentage of phonetic loans.

If, for example, one compares all the overlapping Shijing quotations between the Guodian and Shanghai Museum versions of the Zi yi 綜衣 (ZY) as I have done in the Appendix, one finds that they differ considerably more than our duplicates overall, but not in ratio.

Omissions/additions 3

Even before the important manuscript finds of the recent decades Li Xueqin 李學勤, He Linyi 何林儀, Qiu Xigui 裘錫圭 and the like had already laid out fairly comprehensive frameworks of diachronic and synchronic development of Warring States script, nuanced by choice of medium and levels of formality, that helped make sense of the seemingly endless graphic variability and phonetic loaning.15 From this we know that, for many words, some semantic classifiers and even phonophorics are either optional or interchangeable.16 Some words are even written with wholly independent graphs, e.g. Chu

14 Note that I have omitted the category of stylistic variant from this analysis because the history between these texts would make it time-consuming and irrelevant.

“circumspect” and \( \text{失} \) “to lose” vs. Qin \( \text{慎} \) (慎) and \( \text{失} \).\(^{17}\) Qiu Xigui’s argument for the parallel development of “standard” 正 and “vulgar” 俗 scripts also helped explain intra-regional variation.\(^{18}\)

In the last few years, the excellent work of a new generation of scholars has contributed to an even more nuanced picture of Warring States script and textual transmission. Imre Galambos, Haeree Park and Fan Limei 范麗梅 are each compiling statistics on actual usages in early scripts to uncover the patterns behind which graphs were chosen to write which words.\(^{19}\) This is vital considering Chu and other regional scripts are often treated as nothing more than a bastardized version of the modern standard—that is, modified Qin regional script.\(^{20}\) These scholars all set out to problematize the idea of a standard for this reason; Galambos, for example, likens pre-Qin script to the orthographic chaos of Middle English. However, their aim is not to undermine the concept of standard but to retrace those that actually governed Chu script as an entity in itself.

For example, certain words are consistently written with orthographies featuring different semantic classifiers and/or phonophorics than their Qin counterparts: Chu \( \text{从} \) “to pass” is always written from (\( \text{從} \)) a \( \text{什} \) \( (*\text{hy}^*\text{rajs}) \) phonorphic, c.f. Qin \( \text{从} \) from \( \text{向} \) \( (*\text{kh}^*\text{aj}) \);\(^{21}\) and Chu \( \text{某} \) “scheme” is consistently written from a \( \text{母} \) \( (*\text{mo}^\text{ʔ}) \) phonorphic and 心 semantic, c.f. Qin \( \text{某} \) from a 某 \( (*\text{mj}^\text{ʔ}) \) phonorphic and 言 semantic.\(^{22}\) In both cases the Qin script has conserved the structure of the Western

\(^{17}\) Chu examples are from Guodian Laozi A, slip 11 and Guodian Yucong san 語叢三, slip 59; Qin are examples from Shuihudi 20,196, in Shuihudi Qin mu zhujian 睡虎地秦墓竹簡. Beijing: Wenwu, 1977.

\(^{18}\) See Imre Galambos, Orthography of early Chinese writing: evidence from newly excavated manuscripts. (Budapest: Department of East Asian Studies, Eötvös Loránd University, 2006) and Park, “The Shanghai Museum Zhouyi Manuscript and the Warring States Writing System.” Unfortunately, at this date Fan Limei’s dissertation at National Taiwan University does not yet appear to have been published. I know about her work I learned through her conference paper “Shijing wenben ‘ban ben’ yiwen zuqun de kaocha —jiaojian chu shiniu xuan ma’ (\( \text{詩經》文本‘班本’一字文群的考察——兼釋簡帛《五行》顏色容貌溫賁也) delivered at the 2009 International Symposium of Excavated Manuscripts and the Interpretation of the Book of Odes (Chicago, Sep. 12-13, 2009) and speaking to her personally. In her work she is compiling 異文組群 “lexeme variant clusters” (\?), that is clusters of graphs that are used to express the same root meaning across xiesheng series, e.g. graphs from 分、奔、弁、番、扁 phonorphics that carry the sense of “flying”, “belllicosity” and “mottled”, then isolating the patterns of phonorphics and signifks used for a particular sense in a particular corpus. The idea behind this is that as semantically and etymologically self-contained as xiesheng series and semantic elements may have been in some hypothetical past state, there was a significant amount of semantic bleed between them. This fact, then, requires us to look beyond such constructs to truly understand the script of any one time or place, especially for the purposes of assessing issues of textual transmission and variation.

\(^{20}\) This is, of course, why it is the first ritual duty of the paleographer to “fix the text into the clerical script” 訂定, or to be less anachronistic, the “correct” 正書 or “standard script” 構書—“fix” being the operative word both etymologically (正 and 正) and conceptually. That all Chinese scripts are essentially the same, and all the paleographer needs to unlock their secrets is, basically, a pianpang decoder ring is a very old and ingrained idea. For a classic response, see Chen Mengjia’s 陳夢家 methodological manifesto and criticism of Tang Lan’s 唐蘭 pianpang analysis method in Yinxu buci zongshu 殷墟卜辭綜述 (1956; rpt. Beijing: Zhonghua, 2004), 67-73.

\(^{21}\) Chu example is from GD.LZb13; Qin is example from Shuihudi 23.13. Note that 過 does appear written from a phonorphic in Guodian Yucong san, slip 52 (\( \text{志} \)). However, this is one of the texts identified by Feng Shengjun 魏勝君 as containing undigested Qi script (Guodian jian yu Shangbo jian duibi yanjiu 郭店簡與上博簡對比研究 [Beijing: Xianzhuang shuju, 2007], 250-319).

\(^{22}\) Chu example from Shanghai Peng zu 彭祖, slip 6; Qin example from Shuihudi 32.5.
Zhou orthography (and respectively), and, in a sense, Chu script is making phonological loans. However, these “loans” are clearly regional conventions, not the choices of individual scribes.

Some graphs function differently in the Chu and Qin scripts: Chu, for example, is used consistently to write both “nature” (sjeŋs) and “surname” (sjeŋs), while is used in the sense of “to be born” (sreŋ) and “surname” (sjeŋs), but never for “nature” (sjeŋs). After clericalizing (liding 誦定) these graphs into and respectively, these distinctions are easily lost, and the fact that and are frequent loans in the Standard Script (kaishu 楷書) can complicate our reading of a Chu text.

Furthermore, because Chinese scripts are constantly redistributing lexical loads through graphic differentiation and consolidation, comparison across scripts and eras can be misleading. In FWLX (a9-10), for example, we have the following line:

日之有耳，將何聽? The sun has ‘ears’ but what does it hear? (*-əʔ)
月之有軍，將何征? The Moon an ‘army’ but what does it conquer? (*-əʔ)

This is a pun in Chu script, where 耳 (*njəʔ?) is used to write both “ear” as well as “parhelia” (*njəs), and 軍 (*kjən) is used to write “army” as well as “halo” (*wjəns)—both important astrological omens. Now these lexical loads are now distributed between 耳 and 耳, 軍 and 晕, respectively. Thus, this Chu phrase is actually impossible to convey in our “Correct Script” (zheng shu 正書).

Warring States script existed as the network of family relationships binding conventions of overlapping social communities at the regional and local levels, the most salient unit of which was likely the school or scribal lineage. As irreconcilable as the writing of craftsmen on pottery and weapons between two neighboring states might seem, the whole family of myriad and volatile conventions was predicated on a common lexicon and meta-language inherited from the Zhou. The boundaries between scripts would have been fuzzy and permeable, allowing written texts to travel fluidly through them as

Throughout this study I use the terms “Standard Script,” “modern script” and “Correct Script” to refer to kaishu 楷書 or zheng shu 正書, the standard script adopted in the third century C.E. by the Cao Wei and used until modern times. For the evolution of Chinese scripts, see Qiu Xiguí, Chinese Writing, 59-150.

Daniel Morgan “A Positive Case for the Visuality of Text in Warring States Manuscript Culture” (24 April, 2010) 8
appears to have been the case with the penetration of Ruist ideological tracts into the Chu capital region. Feng Shengjun has convincingly isolated elements of Northern, especially Qi, script at different stages of “domestication” in several Chu manuscripts—the Guodian Wu xing, Tang Yu zhi dao, Zhong xin zhi dao, Yu cong, and the Shanghai Zi yi—reminding us to consider also the possibility of orthographic contamination in discussions of textual transmission and variation.

The complexity of this picture is even more damning for the *stemma codicum* model than the case which Kern (2000) presents. At the same time, however, it also undermines the simple dichotomy—written/oral—that is the cornerstone of a positive argument for the very existence of orality and memory as modes of textual transmission in the Warring States. The Shijing quotations examined in Kern (2005), for example, are in every single case compared across scripts: the Chu script of the Guodian Zi yi against the half-Chu, half-Qi script of the Shanghai Zi yi against the modern script of the Mao recension, and the half-Chu, half-Qi script of the Guodian Wu xing against the Clerical Script of the Mawangdui Wu xing against the modern script of the Mao recension, etc. In each case it would be impossible to isolate hypothetical traces of orality from all the other factors at hand when a text is essentially translated from one script to another to another. Ironically, the presence of half-digested Qi script in these very texts is, instead, unequivocal evidence for visual copying.

To be fair, one might argue that duplicate texts from the same site and Shijing quotes from the Guodian and Shanghai Zi yi MSs are, respectively, too controlled and too small a sample to reflect how texts may have been transmitted over longer periods of time. For this reason I also submitted to

---

28 Feng Shengjun devotes several hundreds of pages to such analysis, from which my table draws only several examples, see his *Guodian jian yu Shangbo jian daibi yanjiu*, esp. 250-506. Feng’s research and the term “domestication” is inspired by the tentative observations of Zhou Fengwu 周鳳伍, “Chu jian wenzi de shufa shi yiyi,” 楚簡文字的書法史意義, delivered at *Giovenzi yu Shang Zhou wenming—di san jie guwenzi dian yu luwenzi xuexu* 古文字與上周文明—第三屆國際漢學會議論文集文字學組 (Taipei, 2002) and Lin Suqing 林素清, “Guodian, Shangbo Zi yi jian zhi bijiao—jian lun Zhanguo wenzi de guowei wenti‖”, in Xin chu wenxian yu gudai wenming yanjiu 新出土文獻與古代文明研究, ed. Xie Weiyang 謝維揚 and Zhu Yuanqing 朱淵清 (Shanghai: Shanghai daxue, 2004), 83-96.
comparison the Guodian *Xing zi ming chu* 性自命出 (XZMC) and Shanghai *Xing qing lun* 性情論 (XQL)—two versions of the same text with at least some history in between them:

</table>

Like the *Shijing* quotes, it is not surprising that these two texts vary at a higher rate than texts presumably copied one from the other, but the similar ratio of typologies is, again, suggestive.

Meaningless stylistic variants aside, of the six sets of texts surveyed herein, the bulk of their differences come down to little more than the act of abbreviation. Abbreviation is perhaps one of the most salient features of Warring States script as a whole—so much so that William Boltz imagines that if the Qin and Han were not to have put an end to it, the Chinese language may very well have developed into a syllabary. 

TZJZ’s abbreviation of 言 to 言 is a perfect example of how texts tend to begin with full forms, then abbreviate in the face of incessant repetition. Furthermore, some hands simply exhibit stronger and weaker propensities to abbreviate, such as the XQL, which consistently writes 情, 惧, 節 and 與 where XZMC has 青, 交, 即 and 与. Closely related is the addition or interchange of seemingly superfluous semantic classifiers. There could be any number of reasons for this—different conventions, mistakes, creative alteration, etc.—but it is important to remember that in most cases this is not random. There are clear patterns of graphic variability throughout the current Chu MS corpus: qing “inner state” (情), for example, is almost always written as 情 or the apparently abbreviated form 青, but never from the semantic classifier 言—which in other graphs is completely interchangeable with 心—let alone from 馬, 人, 食, 火, 日, 鳥, etc.

Of course, the fact of abbreviation implies an opposite process of elaboration. When two MSs differ between full and abbreviated forms, it could just as easily be the case that the hand behind the one

---

29 Unfortunately, because the Shanghai Museum corpus was pilfered from an undisclosed location, we cannot know exactly how far apart it was from the Guodian corpus in time and space.

32 In *kaishu* goggles, the Chu scribe’s cavalier employment of semantic classifiers would seem to mire the language in irresolvable ambiguity; however, in most cases context plays the role of classifier just as well as it does in the modern script, in which, for example, the words “law,” “method,” “France,” and “dharma” are written with the same graph (法) but rarely confused.
had made an editorial decision to fill out the abbreviated forms of the other rather than vice versa.\footnote{Richter, for example, argues that the scribe of TZJZa has filled out the abbreviations of TZJZb in this manner (see below).}

Personal editorial decision is probably also the main factor behind the occasional lexical variant and omission/addition, as well as such outlandish orthographies as FWLX’s consistent addition of a 鼠 “rodent” signific to yi — “unity” \(\text{[A17]}\).\footnote{ Naturally, not all omissions/additions are conscious decisions. Sometimes the scribe appears to have accidentally copied the same line of text twice or skipped over a word or line (see Appendix). Naturally, some lexical variants and omissions could also be construed as the unconscious results of storage in fallible human memory.}

Actual phonetic loaning is so rare as to be statistically insignificant—14 out of 2,669, or 0.5% of my entire sample—and when it does occur, it often involves an obvious etymological or allographic relationship that confounds neat classification.

All of this could be taken one step further. The duplicate manuscripts of the Shanghai Museum corpus show unequivocal evidence of unbroken lines of visual copying, as do those with elements of foreign scripts. Furthermore, because the ratio of variants between the XQL and XZMC is similar, it might seem reasonable to suppose that they were products of the same mode of textual transmission. And because, thus far, almost every text in multiple Warring States editions that we have discovered so far fits this pattern, one might claim that this mode—unbroken visual copying—was the norm. But I suspect that things were not so simple.

**The Visuality of Orality**

It is my hope that the discussion so far has not appeared unduly critical towards Martin Kern’s 2002 and 2005 articles; it is actually my intent argue for a similar theses by reframing the issue at hand. Common sense, cultural comparison and the occasional contemporary testimony tell us that memory and orality must have played a role in Warring States textual transmission.\footnote{Sima Qian’s 司馬遷 commonly quoted account of the history of the Zuozhuan 左傳 only four centuries after the fact, for example:}

For reconstructing modes of textual transmission from manuscripts, Kern’s distinction of “texts with a history” and occasional texts (e.g. legal documents, divination records, tomb inventories) is an
excellent start. It is this distinction, for example, that Feng Shengjun utilizes to isolate samples of pure, indigenous Chu script for comparison with contaminated script. I suggest delineating within this rubric subcategories of texts based on their hypothetical conduciveness to oral vs. visual transmission.

In my comparative work, I found most of the true phonetic variants clustered around only a few lines of the XQL and XZMC—all laconic and rhythmic aphorisms about judging personal character with a rather vague vocabulary, stilted syntax and a number of enigmatic binomes:

Feng Shengjun, Guodian jian yu Shangbo jian duibi yanjiu, 251-2.

My translation the following passage relies on the readings of Li Tianhong 李天虹 and Feng Shengjun in Li, Guodian zhujian Xing zi ming chu yanjiu (Wuhan: Hubei jiaoyu, 2003), 178-80 and Feng, Guodian jian yu Shangbo jian duibi yanjiu, 232-5.

A contemporary example might be the child reciting the Pledge of Allegiance:

I pledge allegiance to the flag.
text that we are most likely to isolate traces of memory and orality. However, this task first requires a significantly larger and more controlled sample—that is, a sample that is demonstrably free of contamination from diachronic and synchronic (inter-regional, intra-regional and personal) discrepancies between orthographic standards.\textsuperscript{39}

Due to the limitations of the current MS corpus, the primary focus of my comparative work has been prose ideological tracts. These texts tend to be repetitive and vernacular, with clear structural logic—features that we might expect to invite a different variety and rate of variation than misheard lyrics. Of course, this is all purely hypothetical; so far, the differences between these texts are too few and too difficult to isolate from personal editorial decisions.\textsuperscript{40}

There is a third category of “texts with a history” that should not be neglected: almanacs, recipe books, incantations, do-it-yourself guides to healing, exorcism, sex and fortunetelling—the real texts of everyday life.\textsuperscript{41} These texts are often laconic, technical and modular, with illustrations and information arrayed in lists, tables and diagrams for easy reference—features better suited for written transmission and storage. Oral transmission seems unlikely for hemerological tables and diagrams or a text like the Mawangdui Tianwen qixiang za zhan 天文氣象雜占, which is little more than a list of captioned illustrations.\textsuperscript{42}

\begin{center}
\textbf{Dangerous comets, Tianwen qixiang za zhan}
\end{center}

of the United States of America,
and to the republic for witches dance,
one nation underdog,
invisible, with liberty and just us for all.

\textsuperscript{39} Another possible avenue for the exploration of the role of orality in textual transmission could be the occurrence of sandhi between compounds and binomes explored in Lai Guolong 來國龍, “Shuo ‘sha’/‘san’, jian tan guwenzi shidu zhong de tongjiazi wenti” 說“殺”·“散”，兼談古文字釋讀中的通假字問題, Jianbo 4, 367-84.

\textsuperscript{40} Lexical variants, for example, and the different ordering and insertion of passages between the XQL and XZMC. See Li Tianhong, Guodian zhujian Xing zi ming chu yanjiu, 6-13; Feng Shengjun, Guodian jian yu Shangbo jian duibi yanjiu, 200-204.

\textsuperscript{41} For an overview of this genre of texts—\textit{shushu 數術}—see Donald Harper, “Warring States, Qin, and Han Manuscripts Related to Natural Philosophy and the Occult,” in \textit{New Sources of Early Chinese History}, 223-252 and Liu Lexian 劉樂賢, \textit{Jianbo shushu wenxian tanlun 簡帛數術文獻探論} (Wuhan: Hubei jiaoyu, 2002). Because of significant overlaps in the growing number of excavated \textit{rishu 日書}, there is excellent potential here to do the same sort of comparative analysis.

Let us not forget that even Confucius, of all people, is on record as constantly *reading* from his favorite divination manual:

孔子晚而喜《易》，《序》、《彖》、《繫》、《象》、《說卦》、《文言》。讀《易》韋編三絕。曰“假我數年，若是我扵《易》則彬彬矣”。

In his later years, Confucius grew fond of the *Changes* and [its commentaries] “The Sequence [of the Hexagrams],” “Tuan,” “The Appended Statements,” “The Images,” “The Explanation of the Hexagrams” and “The Patterned Words.” He read the *Changes* [so often that] the binding broke three times. [Once] he said “Give me a couple more years such that I may be conversantly versed is the *Changes*!”

But much more urgent than such categorization is the reappraisal of how memory and orality potentially functioned. We will never know, to be sure, but it begs to ask: texts (words) surely could have existed outside the confines of the written document, but did they exist only as sounds, disassociated from the script? Or to rephrase the question, is it unreasonable to expect that someone who could commit the words of such an important text as the *Shijing* to memory might also know, or at least be willing and able to memorize, the graphs used to write them? The answer is obvious.

The Warring States undeniably had its share of illiterates for whom language (words) functioned only at the level sound; however, script was central to the identity, way of life and even the cosmology of the literate elite. The *Xici zhuan* 隈辭傳 tells us that human civilization began with Fuxi’s 伏羲 transcription of the patterns of nature into the trigrams, after which, the *Shuo wen jie zi* 說文解字 adds some centuries later, Cangjie 倉頡 creates the first true script “upon looking at the tracks of the birds and beasts and realizing that their distinct patterns could be discriminated” 見鳥獸蹄迒之跡，知分理可相別.
By at least the Warring States period, the Chinese graph is considered the language of nature. This is why, in His solemn communications with mankind, Heaven does not dictate: He sends animals to vomit up scrolls to read and commits His directives to "skywriting" 天文. Likewise, the living do not speak but write to their deceased ancestors, who respond with trigrams and crack-patterns on tortoise plastrons. This entire worldview is no doubt why, considerably later, when from the very beginnings of

---

44 Zhouyi zhu 周易注 (Siku quanshu 四庫全書 (SKQS) electronic ed.), 8.2a-b; Shuowen jiezi zhu 説文解字注 (Shanghai: Shanghai guji, 2003), 15A.1a-b.

45 This was how the Zhou Dynasty was thought to have begun, for example:

這全乎商王封，天不序其德，祀用失時。兼夜中，十日雨土于薄，九鼎遷止，婦妖宵出，有鬼嗥吟，有女為男，天雨肉，棘生乎國道，王兄自縱也，赤鳥銜珪，降周之岐社，曰：「天命周文王伐殷有國。」泰顛來賓，河出綠圖，地出乘黃。武王踐功，夢見三神曰：「予既沈漬殷封于酒德矣，往攻之，予必使汝大堪之。」武王乃攻狂夫，反商之周，天賜武王黃鳥之旗。

In the case of King Zhou of Shang, Heaven took umbrage at his virtue, and sacrifices were not held according to the seasons. For ten days and ten nights it rained earth at Bo, and the nine cauldrons moved about. Female goblins came out after dark and there were ghosts wailing at night. Women turned into men, flesh rained down from Heaven, and brambles grew on the national highways. And yet the king grew even more dissolve. A red bird holding in its beak a jade tablet alighted at the Qi earth altar of Zhou, [the tablet reading]: “Heaven orders King Wen of Zhou to attack the ruler of Yin.” Taidian came as a guest, the River revealed records and charts, and the land disgorged the “riding-yellow” [beast]. King Wu ascended the throne and dreamt of three spirits who said to him: “We have already drowned Zhou of Yin in the power of wine. Go and attack him, and we will assuredly cause you to win great victory over him.” King Wu thereupon attacked the deranged man and overturned the Shang for the Zhou, [whereupon] Heaven bestowed a yellow bird pennant to King Wu. （Mozi 墨子 [SKQS ed.], 5.10a; tr. modified from Burton Watson, Mo tzu: Basic Writings [New York: Columbia, 1963], 57-58)

Here spirits do talk to King Wu in a dream, but later versions tend to focus solely on the procurement of physical texts from the mouths and stomachs of animals—the details of which are progressively elaborated—e.g.: Lü shi changju 吕氏春秋 (SKQS ed.), 13.5a, Shuo yuan 說苑 as cited by Zhang Shoujie 張守節 in Shiji zhengyi 史記正義 (SKQS ed.), 23.1b, and Lunheng 論衡 (SKQS ed.), 22.14b. By early imperial times, this trope is so fixed in the popular imagination that it becomes the frequent subject of political hoaxes: e.g. Chen She’s 陳涉 rebellion against the Qin begins with a piece of silk declaring his future kingship planted in the belly of a fish (Shiji 48.3a) and General Wencheng’s 文成將軍 feeding a prophetic document to an ox after failing to ingratiate himself with Han Emperor Wu by invoking the spirit of Taiyi (Han shu 漢書 [Zhonghua shuju ed.], 458-59).

On the communication with ancestors through texts, see for example Lothar von Falkenhausen, “Issues in Western Zhou Studies: A Review Article,” Early China 18 (1993), 146-56. As the earliest systematic treatise on the topic, the “Gu ci liezhuàn 龜策列傳” (Shiji 68) describes divination by yarrow and tortoise shell as a communication with the “spirits” (shen 神). Both are “numinous” (ling 禮) materials conducive to possession: in the case of the former, spiritually possessed yarrow wands lead one to the hexagram appropriate to one’s current situation; in the case of the latter, the spiritually possessed tortoise shell produces cracks, which are interpreted as images. The interpretation of the crack-as-image also appears in pre-Qin literature, e.g. Guoyu 國語 (SKQS ed.), 7.2a-b:

獻公卜伐麗戎，史蘇占之，曰：‘勝而不吉。’公曰：‘何謂也？’對曰：‘遂兆，挾以銖骨，齒牙為嚼，戎、夏交捽。交捽，是交勝也，臣故云，且懼有口，騰民，國移心焉。’公曰：‘何口之有！口在寡人，寡人弗受，誰敢興之？’對曰：‘苟可以攜，其入也甘受，逞而不知，胡可壅也？’

Duke Xian of [Jin] performed crack-making on attacking the Lirong, and Scribe Su prognosticated [the crack], saying “Victorious but inauspicious.” The Duke asked, “What are you saying?” [Su] responded, saying “We have encountered a crack which is enveloped like a bone held in a mouth, infringed upon [on all sides] by teeth—the struggle between Rong and Xia. Struggle means the exchange of victories, thus your humble servant says that we must for now fear that there is a ‘mouth’ that will sow discord in the populace and to which the hearts and minds of the nation will move.” The Duke said, “What ‘mouth’ could there be? The ‘mouth’ is here with me, the solitary one, and if I do not admit it, who would dare promote it?” [Su] responded, saying “If discord can be sown its entry will be gladly admitted, content and unknowing, and how can it be stopped?”

Daniel Morgan “A Positive Case for the Visuality of Text in Warring States Manuscript Culture” (24 April, 2010) 15
time and space, the rarified, supernatural language of the immortals was revealed to Daoists, it was not as sounds, as with Indian dhāraṇī, but as graphs.\(^{47}\)

Even before the *Shuo wen jie zi*, a similar brand of graphic etymology captivated the imagination of the literate elite. In received literature this is portrayed as a common and effective rhetorical device. For example:

楚子曰：「夫文，止戈為武。」
The viscount of Chu said, “Now, in terms of the written graph, “stopping” 止 “dagger-axes” 戈 is what makes “militarism” 武. (*Zuo zhuan* 左傳, Xi 12)

天反時為災,地反物為妖,民反德為亂,亂則妖災生。故文反正為乏。
In Heaven, the inversion of the seasons makes natural disasters; on earth, the inversion (: perversion) of creatures makes goblins; amongst the populace, the inversion of virtue makes disorder—and with disorder is born natural disasters and goblins. Thus, in terms of the written graph, the inversion of “correctness” 正 makes “destitution” 乏. (*Zuo zhuan*, Xuan 15)

趙孟曰「何謂蠱?」對曰「淫溺惑亂之所生也。於文。皿蟲為蠱。」
Zhaomeng asked, “What is meant by gu 蠱?‖ [Doctor He] responded, “It is born from one’s wanton abandon in delusion and bedlam. In terms of the written graph, “bugs” 蟲 in a “bowl” 皿 makes gu 蠱.” (*Zuo zhuan*, Zhao 1)

古者蒼頡之作書也,自環謂之「厶」,背厶謂之「公」。公私之相背也,乃蒼頡固以知之矣。
In antiquity when Cangjie invented writing, circling (: looking out only for) oneself was called *si* 亙 and turning one’s back to *si* 亙 (: selfish self-circlers) was called *gong* 公 “public spirit”. (*Hanfeizi* 韓非子, “Wu du” 五蠹)\(^{49}\)

The *Zhou li* 周禮 tells us that “writing” 書 was one of the “six arts” 六藝 comprising the Zhou aristocrat’s basic education.\(^{50}\) One can imagine that at one time, this ability would have probably been a distinction central to the aristocrat’s identity. However, by at least the time of the Zhangjiashan 張家山 *Er nian lü ling* 二年律令 (interred ca. 186 B.C.) the state demanded an impressive degree of literacy from even the lowliest of clerks:

---

\(^{48}\) Here Du Yu 杜預 glosses gu as “dementia caused by matters of excess” 惑以淫事 (*Chunqiu Zuo zhuan zhushu* 春秋左傳注疏 [SKQS ed.], 9.21a). However, gu is usually a poison made by trapping a collection of nasty, poisonous creatures in a container until there is only one left. There is definitely a metaphorical connection between these two senses here.

\(^{49}\) In pre-Qin scripts 亙 is written as a circle. According to the *Shuo wen jie zi*, “八 is ‘to separate. It looks like separating [two] things with their backs to each other’ 別也。象分別相背之 (*Shuowen jiezi zhushi* [SKQS ed.], 9.21a). This invokes the imagery of 北, which it describes as “from two 人 with their backs to each other” 从二人相背 (*Shuowen jiezi zhushi* [SKQS ed.], 8.44a).

\(^{50}\) *Zhou li zuo zhushu* 周禮注疏 (SKQS ed.), 10.35a. The “six arts” are: rites, music, archery, chariot driving, writing and math. Curiously, oration is not one of the six arts.
The clerical students shall be tested on the Fifteen Chapters, and only when they can read and write more than five thousand graphs are they eligible to become clerks. Furthermore, they shall be tested on the eight scripts. (s476)\(^{51}\)

All of this tells us that the educated Warring States man probably had writing on the mind. And if so, this leads me to believe that when texts were stored in memory and transmitted in speech, these texts may have been every bit as “visual” or visualized as their written counterparts.

One possible difficulty this supposition faces is the work of scholars like Matsumaru Michio 松丸道雄, Li Feng 李峰, Matthias Richter, and Li Songru 李松儒 in identifying traces of illiteracy in excavated pre-Qin texts. Matsumaru and Li Feng both examine duplicate Western Zhou bronze inscriptions in which one inscription is textually and calligraphically inferior to another as evidence of local copying by illiterate or semi-literate craftsmen.\(^{52}\) Richter and Li Songru, on the other hand, apply a similar methodology to Chu MSs.\(^{53}\) Richter, for example, argues that ① the scribe responsible for TZJZb was less experienced than that of TZJZa because his calligraphy is not as neat, he tends to add decorative brushstrokes to graphs, he often fails to produce “correct graphs” 正字, and he uses less reader’s marks; and that ② because TZJZa has fewer “mistakes” and a more controlled calligraphy but at the same time shares the more peculiar forms of TZJZb, it must represent a fair copy of TZJZb, done by a more competent individual due to dissatisfaction with the latter.

Such analysis must necessarily rely on a number of problematic assumptions. First, quality of penmanship is subjective and cannot be equated with literacy—otherwise, we might as well dismiss Hanfeizi’s philosophical credentials on account of his stuttering. Second, we do not know who was copying what: in the conceivable situation where students or cheap labor could have been employed to mechanically copy large amounts of texts, the manuscript itself could be a misleading indicator of the literacy of both the author and the end-user.\(^{54}\)

\(^{51}\) Zhangjiashan ersiqi hao Han mu zhujian zhengli xiaozu 張家山二四七號漢墓竹簡整理小組, ed., Zhangjiashan Han mu zhujian (ersiqi hao mu) 張家山漢墓竹簡(二四七號墓) (Beijing: Wenwu, 2001). The “Fifteen Chapters” are usually identified with the Shi Zhou pian 史籀篇, which the Han shu “Yi wen zhi” 藝文志 records as being in 15 chapters (Han shu, 1719).

\(^{53}\) Richter, “Shi tan shuxiezhe de shizi nengli ji qi dui liuchuan wenben de yingxiang” and “Faithful Transmission or Creative Change: Tracing Modes of Manuscript Production from the Material Evidence;” Li Songru, “Zheng zi Jia sang jia yi ben ziji yanjiu” and “Fan wu liu xing jia yi ben ziji yanjiu.”

\(^{54}\) While it is not my intent to dwell on “what ifs,” it should also be noted that any “poorly written” MS may well be writing practice, in which case it might be a similarly misleading indicator of literacy ultimately attained by the student, let alone of a text’s author or broader audience. For a study of clear cases of Han writing practice on wood, see Xing Yitian 邢義田, “Handai bianzai lizi de junzhong jiaoyu” 漢代邊塞吏卒的軍中教育, in Jianbo yanjiu 簡帛研究, vol. 2, ed. Li Xueqin (Beijing: Falü, 1996), 273-78.
Third, and most importantly, while I agree with Richter’s insistence of standards at the level of scribal lineage, I do not share his confidence that we possess sufficient evidence to determine what those standards were. For example, Richter (2009: 904) gives the graph 臨 (below) as one of the examples where TZJZa has corrected the wrong orthography of TZJZb. It is true that TZJZb’s orthography is currently unprecedented, but at the same time, pre-Qin scripts frequently duplicate single components and vice versa without affecting the meaning of a graph. The Baoshan materials feature a different and similarly unprecedented abbreviation (BS185) alongside the full form of TZJZa (BS33 and BS53) in the same place name—Linyang 临陽. So, in this situation how do we judge which is “correct,” which is a “mistake,” and which is simply an abbreviation?

56 Given these sorts of problems and the fact that the illegibly bizarre graphs are faithfully reproduced in both manuscripts, it seems just as easy to argue that TZJZb is instead an abbreviated copy of TZJZa.

Let us return to the XQL and XZMC. Both feature typical Chu orthography, allowing us to eliminate the influences of translation across scripts. Recovered from different tombs, they are likely several steps removed from each other in a line of transmission. While still essentially identical, they do feature more of each category of variant—facts that could be attributed to the compounding of variation through the repeated processes of largely faithful copying and/or “visualized” oral transmission. Indicators of unbroken copying are few and equivocal: both texts end with a punctuation hook and share

---

Daniel Morgan “A Positive Case for the Visuality of Text in Warring States Manuscript Culture” (24 April, 2010) 18
the relatively rare orthography 静 (XQL27/XZMC62) for “still.”

Evidence is similarly bleak for memory and orality, where the only promising lead is phonetic variation—an exceedingly rare phenomenon currently impossible to untangle from complex issues of script and personal choice. Therefore, that the XQL and XZMC are connected by copying, oral transmission, or some combination of the two is all equally likely, and all equally indemonstrable.

Summary

In this paper I have submitted seven sets of duplicate Warring States texts to graph-by-graph, stroke-by-stroke comparison. This comparison shows that the texts recovered from the same tomb—presumably close in time and space—exhibit remarkable fidelity in terms of overall variance (av. 6.7%) and the reproduction of visual idiosyncrasies, the latter of which is unmistakable evidence of visual copying. The texts recovered from different tombs—presumably further removed—exhibit a higher rate of overall variance (av. 31%); however, in both cases the majority of differences boil down to the mundane abbreviation and elaboration of graphic forms, the simple products of different orthographic conventions and personal choice. When conscious, the rare lexical variant and omission/addition is probably also attributable to editorial decision. At the bottom of the list, phonetic variants are as statistically insignificant (av. 0.5%) as they are difficult to accredit decisively to personal editorial decision, differing orthographic conventions, or the effects of memory and orality—especially when such variants frequently involve ambiguous etymological and allographic relationships, and when we know next to nothing about the standards of different intra-regional orthographies.

In as much as these fourteen texts are representative of Warring States practices, they either demand that visual copying was the norm or they call for a new theory of orality: that the educated Warring States man was capable of remembering and communicating the sonic, semantic and graphic facets of a text’s language (words). When resulting in a written text preserved for us to examine, this literate or “visualized” theory of orality would function similarly to copying—reproducing the graphs of a text—and would thus blur the distinction between oral and written transmission in all but clear and proximate cases of copying, relegating arguments for or against one mode of transmission in other instances to the realm of pure speculation.

57 Other than concluding with a hook, which is quite common, the punctuation of both MSs does not exhibit compelling similarity. “Still” 静 is from 静 in all other occurrences in the Chu MS corpus except once in the Shanghai Museum Xiang bang zhi dao (s1) where it is also written 静.
Appendix: Textual Variants between Editions of Texts in Chu Script

My intent is to illustrate both how and how much different Chu editions of the same text vary. When using this appendix, I urge the reader to keep the following caveats in mind. First, the appendix only compares texts where they overlap and are clear enough to make out, not where they would overlap if not for some defect of the physical bookmat. Second, the appendix deals with orthographic variation only in as it informs the issue of textual variation. This is to say that my goal is not to explore how the graphic forms of a script vary in a time, place, or a single person’s handwriting, but how texts vary between editions. Lastly, I have undoubtedly made a number of mistakes, omissions and arbitrary decisions in the process of collating this data from such a large sample, but the overall results speak for themselves. I welcome emendations and suggestions.

In terms of sources, I rely heavily on the analysis of Feng Shengjun 馮盛君 and Li Songru 李松儒 on three texts and will frequently refer the reader to their works with the following abbreviations:

* All percentages are rounded to the nearest tenth.

### Omissions/additions

| 0 |

### Stylistic variants

- **A1/B1**: 都. MSB prefers decoration.
- **A3/B2**: 者. Both MSs alternate between 口 and 甘 elements.
- **A7/B6**: MSA variant unattested. Total of 6 overlapping discrepancies.
- **A4/B3**: 得.
- **A5/B4**: 事. After first instance, both MSs follow MSB orthography. This is probably evidence of MSA having been copied from MSB. E.g.: A9/B8 A10/B9

### Graphic variants

- **A6/B5**: 坐. MSB identical but executed poorly.
- **A7/B6**: 候. MSB inverts graph in this one instance.
- **A10/B9**: 不. Near the beginning, MSB consistently uses the decorative orthography of MSA but begins to abbreviate at B9. Total of 12 overlapping discrepancies.
- **A12/B11**: 余. MSB features 口 semantic.

### Phonetic Variants

- **A5/B4**: 直 得. MSA abbreviates by omitting 心 semantic in first two cases, but provides full form later down: A5/B4 A5/B4 A5/B4 A8 A8/A7/B6
- **A5/B5**: 直 得. MSA appears to have exchanged 人 for 王.
- **A3/B2**: 直 得. MSA abbreviates by "straight" to represent the word *tək* “obtain” (得). Of course, this is probably not a pure phonetic loan considering 直 could well be standing for 德 (*tək), which is etymologically related to 得.
- **A11/B10**: 不. MSA orthography is consistent with most other MSs. MSA abbreviates by omitting one of the bottom elements. This is unattested, however, Baoshan does offer an even more radical abbreviation in several places: BS53 BS79
- **A11/B11**: 得. MSB features 口 semantic.
- **A8/B8**: 余. MSB features 口 semantic.

<tbody>
<tr>
<td>家. MSB component consistently 'simplified' as 入, the top stroke merging with 入 twice near the beginning (B1.2, B2.19). MSA begins with the more elaborate 家, an unprecedented variation on the other common orthographies 家 or 家, etc. The bottom of 家 is simplified to 家 from A5 to the end. Hand A appears to have either begun to emulate Hand B, or simply lapsed into a common abbreviated form.</td>

Stylistic variants

曰. MSA prefers a flat upper stroke until near the end of the text, where it features a form similar to MSB (e.g. A20 ). This change coincides with the change in hands identified in LSR (B).

心. MSA and MSB curve different directions. MSA changes orientation around shift in hand.

井、进. MSB vertical strokes of 井 do not protrude. Both orthographies attested, but protrusion more common.

城. Decorative stroke.

單. MSA inward stroke of top component curves inward, contrary to common MS orthography, e.g. 《語叢》三 2.

若. MSB appears to possess at least one extra stroke.

逆. MSA seriously deficient.

老. MSB 止 is either abbreviated with =, or written peculiarly parallel.

智. MSA is from 甘, while MSB is from 甘. Furthermore, Both MSs are consistently from 甘 instead of 大, 去 or 矢. This orthography is not attested (e.g. 《民之父母》 2), however, it is exceedingly rare. This contiguity is further evidence of copying.

之. MSA omits the bottom of the full form of 先, leaving 之. Context favors 先 (both "wis", "prescience"). LSR (B) suggests that this is a mistake, but one cannot ignore the possibility that it was a conscious emendation or abbreviation. Elsewhere MSA also features the full form, e.g.:

之、先. MSA prefers a flat upper stroke until near the end of the text, where it features a form similar to MSB (e.g. A20 ). This change coincides with the change in hands identified in LSR (B).

之、先. MSA prefers a flat upper stroke until near the end of the text, where it features a form similar to MSB (e.g. A20 ). This change coincides with the change in hands identified in LSR (B).

天而. MSA here confuses orthographies for 天 and 而.

Graphic variants
- 義. SB from 土 semantic, GD from 心.
- 镅. SB from 刀 semantic.
- 萬. SB from 士 semantic.
- 革. SB from 爭, GD from 心.
- 恭. Allographs. SB from 龍.
- 好. SB gives Qi orthography.
- 功. Both from 工 phonophoric.
- 國. GD from 亙 semantic.

Phonetic
- 氏. is "truth" (*djeʔ) and 氏 "surname clan" (*tsjeŋ) are used interchangeably in Chu script as if they are phonologically viable loans in the Chu language.
- 豆. Chu 卒 differentiated from 衣 with horizontal line, but other states *vice versa.*
- 本. Both from 貝 semantic.
- ्. Apparently SB is an unmarked *hewen* containing the phonophoric of GD, 變.
- 』. GD from 石 semantic.
- 一. Allographs. GD from 戈 semantic.
- 去. GD from 心 semantic.
- 指. SB from 見 semantic.
- 歩. GD from "awe" and 走 (*ʔjujs) "fear" are allographs.
- 歩. GD from 對 semantic.
- 氏. GD from "truth" (*djeʔ) and 氏 "surname clan" (*tsjeŋ) are used interchangeably in Chu script as if they are phonologically viable loans in the Chu language.

香港带从 SB corpus here reads 容. Both are from 公 phonophoric and are interchangeably in Chu MSs.

FSJ (2007: 123-127) shows that these two graphs are both actually from 革 phonophoric.

©. "awe" and 走 (*ʔjujs) "fear" are allographs.
Lexical

貞・正. 貞 “divine” (*trjeŋ) and 正 (*tjeŋ) “correct” are etymologically related homophones.

Binome. SB 鬱 (*krijjʔ) vs. GD from 隤 (*tsjip). These do not appear to be phonologically viable loans, thus are likely lexical variants.

義務. GD is apparently a scribal error.

See FSJ (2007: 180)

Overlapping graphs: 1177

**Stylistic variants**

- XQL1/XZMC1
  - 35 instances of divergence. XZMC sometimes omits decorative stroke.
- XQL5/XZMC3
  - 7 instances of divergence
- XQL4/XZMC9
  - 2 instances of divergence
- XQL14/XZMC30
  - 2 instances of divergence
- XQL1/XZMC1
  - 2 instances of divergence

**Graphic variants**

- XQL1/XZMC2
  - Overlap of 28 graphs and 5 graphs. XQL sometimes reflects the same orthography as XQL, e.g.: XQL23
- XQL2/XZMC3
  - 2 instances of divergence

*Due to the enormity of this text, I provide one example and note the number of occurrences for instances where the two editions differ repeatedly in the same fashion. Furthermore, I have left alone the rather complicated issues of textual order.*
that the phonophoric. Bai Yulan argues to suggests phonophoric, and context implies "be happy". XQL appears to be from "rivoj" phonophoric. Bai Yulan argues to read it "wisdom" (*wenti) due to parallel appearance near end of MS (see below). Qiu Xigui1 argues that the の of の, has simply migrated downwards, making it still the same graph.

1 See FSJ p. 215.
Phonetic variants

XQL abbreviates double 局 to single. C.f.:

1. XQL from 童 (*dong) phonophoric; first occurrence in XZMC from 童 (*dong), all subsequent occurrences from 童. There is significant overlap between these two xiesheng series.

2. XQL from 登 (*tang) phonophoric; XZMC from 鬼 (*tang). Elsewhere, the latter orthography is generally used for the word “evidence”, e.g.:

However, the XQL graph is a viable loan.

要, XQL uses 要 “important” (*jew) as loan for 要 (*tjew) “ballad.”

XQL from 要 (*kjiuja) phonophoric; XZMC from 要 (*kjija) phonophoric.

XQL from 有 (*gew) phonophoric; XZMC from 有 (*gew) phonophoric. Former appears to be loan for latter. See FSJ (2007: 233).

XQL from 有 (*gew) phonophoric; XZMC from 有 (*gew) phonophoric. Both apparently loans for 有 (*gew).

3. For examples of graphs from standing for graphs featuring the phonophoric 登 in the modern script, see Bui Yulan 白於藍, *Jian du boshu tongjia zidian* 简编帛書通假字典 (Fuzhou: Fujian jenmin, 2008), p. 241.

XQL apparently from 被 (*tshjit) phonophoric and 人 semantic; XZMC from 即 (*tsjik) phonophoric and 人 semantic. XQL appears to be a loan for XZMC, but it is difficult to rule out the possibility that they represent two different words since they appear in a vague binome. See FSJ (2007: 235-6).

XQL from 柒 (*tshjit) phonophoric and 人 semantic; XZMC from 即 (*tsjik) phonophoric and 辵 semantic. XQL appears to be a loan for XZMC, but it is difficult to rule out the possibility that they represent two different words since they appear in a vague binome. See FSJ (2007: 235-6).

XQL37/XZMC44

XQL39/XZMC49

XQL apparently from 柒 (*tshjit) phonophoric and 人 semantic; XZMC from 即 (*tsjik) phonophoric and 人 semantic. XQL appears to be a loan for XZMC, but it is difficult to rule out the possibility that they represent two different words since they appear in a vague binome. See FSJ (2007: 235-6).

XQL from 柒 (*tshjit) phonophoric and 人 semantic; XZMC from 即 (*tsjik) phonophoric and 辵 semantic. XQL appears to be a loan for XZMC, but it is difficult to rule out the possibility that they represent two different words since they appear in a vague binome. See FSJ (2007: 235-6).

Lexical variants

XQL1/XZMC1

正·奠. 正 (*tjeŋ) “fix” and 奠 (*dins) “base”, “fix” are etymologically related, thus this does not appear to be phonological loan. Both orthographies occur elsewhere in both texts.

XQL18/XZMC30

恒·殺. This graph occurs in a compound “浸(噍)~” descriptive of the act of crying. Scholars have read XQL as 焊、是 and 帚. XZMC is from 佈 phonophoric, 氷 semantic. See FSJ (2007: 222-3).

XQL23/XZMC54

Editors read as different words—廣廣 vs. 注注. Li Ling suggests XZMC 主 phonophoric might be mistake for the 佈 phonophoric of XQL.6

XQL28/XZMC65

居·扈. Essentially homophones and synonyms. 3 instances of divergence.

Omissions/additions

XZMC34-35 adds 40 graphs (喜斯…愽之終也)
XQL8 adds 也
XQL21 adds 也
XQL39 has punctuation vs. XZMC49 has 矣
