

Towards the Formalization of Metadata Network Analysis in History: a Complex and Multidimensional Case Study

Martin Grandjean, University of Lausanne

This contribution focuses on understanding the structuration of scientific and cultural coordination in the inter-war period, based on the archives of the International Committee on Intellectual Cooperation (ICIC) of the League of Nations.¹ This case study allows the establishment of a plurimethodological reflection on the contribution of network analysis in the humanities in general. This perspective, which consist in developing a quantitative and structural analysis jointly mobilizing mathematical theories, computer sciences and archival questioning, is also a way of questioning the relationship between historical research and digital technologies. Without however making these technical developments an end in itself, the contribution of such methods of social network analysis and visualization makes it possible to multiply the perspectives, to play with the scales and to allow the navigation between a global overview of the structure (here, an international organization) and an approach closer to the individuals.

Created in 1921, the ICIC is a committee bringing together leading scientists such as Henri Bergson, Albert Einstein, Marie Sklodowska-Curie and Hendrik Lorentz. First constituted as a consultative body, the ICIC gradually built up around itself a full “intellectual cooperation organization” comprising several sub-commissions and secretariats, involving experts in bibliography, copyright, academic exchanges, university relations, etc. It laid the foundations of UNESCO after the Second World War. The rise and bureaucratization of this organization during the 1920s is accompanied by a rapid increase of the number of documents produced and received as well as a complexification of information flows. Reversing the process of making a study of international organizations by their discourse or focusing only on the most prominent personalities of the institutions, this research proposes to analyze the activity and the ability of the ICIC to create link through a fine indexing of its correspondence archives. By mapping this circulation in a network composed of more than 3.000 individuals involved in intellectual cooperation during its early years (1919-1927, approx. 30.000 documents),² this method reveals the main organizational trends while highlighting the situation of actors that are so far little studied in this context.

This exploratory “datafication” of the archives of the League of Nations leads us to reconsider and recontextualize the personal commitment of the individuals who made up the ICIC. Thus, the development of visualization methods that allows a comparison between the official institutional framework of the international organizations of this time and the structuring of information exchanges at an individual level helps to highlight the discrepancy from a hierarchical level to another. More generally, this research develops a framework for coding, analyzing and interpreting such metadata networks in history.³
